To the Editor of THE SANITARY ENGINEER:

Enclosed find a sketch of a *scientific* job of plumbing done by a would-be plumber, gas and steam fitter, a rising young man whose aim is to make people think he knows it all. He being a good talker, used it to good advantage on the owner, who thinks he has got a good job. The trap at closet has been stretched out till it looks like an offset, it also being fitted into the soil pipe, which is hanging by the trap, the bend going through the foundation wall. The air pipe, of which there is but one, is 1¼ inchs this pipe is also resting on the top of trap. The trap for bath and basin in bathroom is situated in the cellar; this also has been stretched out till it has no trap. The waste pipes are all run on the snake plan, thus: The waste for basin on ground floor is supported from the ceiling with straps. Joints on waste are bolted, and same on supply, only those on supply being rasped and sand papered, giving them a polished appearance. I think this will convince you the young man is going wrong.

I hope you will ventilate this.

Respectfully yours, E. H. R.

[We have seen some worse jobs than the one here described, but not many.]

EXPLODING WATER BACKS.

[From our Special Correspondent.]

CHICAGO, *Jan*, 25, 1883.

With the thermometer ranging below zero for four consecutive days, sometimes going as low as 24, Chicago plumbers have made hay in the past week.

I asked two of them, in view of the fatal explosion of a water back in Architect Burling's house, what was their best word to housekeepers owning these useful kitchen appliances. "My advice is," said each of them, in substance, "to let the water run constantly in severe weather. To simply shut off the water will not do, for though the water is 'all drawn off' as we say, there will still be considerable left in the water-back. The greatest danger from frozen pipes is when a sudden thaw comes on. They should never be left to thaw out of themselves, but should be attended to at once with hot water and cloths, and not of course by kindling fires beneath them, the cause, as I see, of not a few blazes in tenements the past week. Of course the best way to cure a sick pipe is to call in Dr. Plumber. Prevention however, is better and cheaper yet, and I repeat that in the case of water-backs and all other pipes, the proper course during a cold snap like the present, is to keep the fire in stove or furnace going constantly."

[THE SANITARY ENGINEER on page 277, issue of March 2, 1882, contained an illustration and suggestions for the guidance of householders in such emergencies.]

VENTILATING DRAINS BY THE KITCHEN STOVE.

The Hamilton, Ontario, *Times*, alluding to our criticism of a scheme proposed by it to ventilate sewers by the aid of a kitchen fire, says:

"The comments of our New York contemporary are rather amusing, in view of the fact, which the writer appears to have forgotten, that the plan of house drain ventilation described by the *Times*, and now so severely condemned by THE SANITARY ENGINEER was proposed by the same SANITARY ENGIEER about a year ago. It was from the columns of our learned contempory that the *Times* borrowed the idea, and in spite of its author's recent repudiation of it, the idea seems to us to be a good one. The air in an iron chamber connected with a furnace or range would be heated to 300° F. Being rarefied by heat, it must be drawn to the chimney flue, where there is an upward draught. A vacuum being formed in the hot chamber, the air from the house drain must rush in to fill the vacuum, and the draught continuing toward the chimney, the current from the drain must be continuous. This seems reasonable, and when THE SANITARY ENGINEER first described the scheme, it was stated that it worked admirably, even when the iron chamber was cracked and the connecting pipe leaky. Our contemporary's point about detailing somebody to "man the stop-cock," is not well taken. The idea of the *Times* was to apply the system only to houses in which a fire is kept in furnace or range, night and day, from fall till spring, and the stop-cock would be left closed all summer, dependence being placed for ventilation on the extension of the soil pipe through the roof, the opening of windows, etc. The *Times* is not a special organ of the Hamilton foundries, but it would like to know what new light THE SANITARY ENGINEER has received since it recommended the hot-chamber plan of house drain ventilation."

We regret that the *Times* has not been more explicit and given us the page and issue of THE SANITARY ENGINEER in which we made the recommendation in question. We have repeatedly criticized similar propositions made by correspondents and in other publications, but we are unable to recall a single instance where we have commended the idea. If the *Times* will kindly indicate where THE SANITARY ENGINEER ever spoke approvingly of such a device, we will promptly withdraw our commendation. That in the case of water-backs and all other pipes, the proper course during a cold snap like the present, is to keep the fire in stove or furnace going constantly."

THE FLUSHING OF CHICAGO SEWERS.

Under the title "What must we do to be saved?" Mr. Andrew Young, a Chicago plumber, read a paper before the Master Plumbers' Association of that city, in which he criticized pretty sharply the methods of the City Board of Health. The graphic description of the flushing of the sewers we here quote:

"The master minds who preside over that part of the bowels of the city, the sewers, wrestled with the problem of how to move the accumulation of mud and matter liable to settle in the sewers of the city. Great emergencies produce great men and methods. The Sewerage Department was equal to the occasion. A wagon was built, a tank added, and the vexed problem was solved. You have, no doubt, seen it. The tank is filled at the nearest fire-plug—the sunny side of the street in winter, the shady side in hot weather. Four to six men with rubber boots, oil-skin jackets and hats, accompanied by short clay pipes well seasoned, and with an unmistakable brogue, watch the process of filling. The tank filled, it is drawn to the nearest man-hole, the cover raised and its contents emptied into the sewer. The outfit includes a ladder. One of the men calmly and deliberately takes the ladder from its resting place on the wagon, and carries it, with the assistance of another, to the man-hole, placing its bottom in the sewer. The third man, knocking the ashes from his pipe, or giving it to an assistant to hold, descends the ladder. He returns. The ladder is taken up; two men carry it to its place on the wagon. A fourth man replaces the man-hole cover. The fifth man looks at the cover, when put back, to see if it is really there. They all fill and light their pipes, and the procession moves on to the next man-hole, where the process is repeated. This is called flushing the city sewers, and this in the city of Chicago.

"The expense of this outfit is $20 a day for horses and wagon. It has been in existence some fifteen years, and has cost money enough to have provided a sensible and feasible plan for flushing and cleaning the city sewers. The parks are the lungs of the city. Let us make them useful as well as ornamental. Instead of excavating for the lakes, have at least one at as high an elevation as the flow from the artesian wells will allow, this lake to be used for periodical flushing and cleaning of the city sewers. For other parts of the city, not convenient to the parks, let artesian wells be sunk and automatic flushing-tanks provided. The water from the wells already sunk is strongly impregnated with sulphur, which makes it valuable as a disinfectant and cleansing agent. These wells might be located in the center of our streets not occupied by car-tracks, made ornamental as fountains and useful as watering-places for man and beast. Here is a permanent remedy for foul sewers within our reach. Let us take advantage of it. Were this plan adopted, we might be able to dispense with that abomination of filth and corruption nursed under houses or nurtured in the yard, the catch basin. It ought to be done away with, except in rare cases. Not one practical plumber in a dozen can recommend it in connection with a private house; or if we must have something of the kind, let it be in the shape of a Field's or Williams' flush-tank."

Mr. Young thinks the sanitary condition of all places where food is sold should be strictly looked after.

"Take for example a building that has formerly been used as a saloon. The saloon-keeper, during his occupancy, put in urinals and water closets for the use of his patrons. He moves out, taking everything of value he put in. The building is now rented for a meat market. An ice-box is built. A tin-smith lines the box. A tin waste-pipe is made and carried to the sewer opening formerly used for the water closet, and communication is established between your beef-steak and the sewers of the city. This is no exaggeration. Not one ice-box in the dozen has its drips connected with any regard to sanitary laws. Every market or building about to be used as such, should be the subject of weekly inspection. Few of our citizens have any idea of the place where butter, eggs, cheese, game and poultry are stored and for sale upon South Water street, reeking with filth and refuse of all kinds, decayed vegetables stinking and too vealey veal, rotten fish, flesh and fowl. Take a walk through it and ask yourself the question: Can food be healthy, stored for one hour in such a place?"

The certificate of incorporation of the Rochester Sewer Pipe Company was filed the 24th ult. Capital $100,000.

Correspondence.

SIZE OF WATER CLOSET OUTLETS.

To the Editor of THE SANITARY ENGINEER:

BOSTON, *Jan.* 16, 1883.

Will you please inform me what you consider the proper diameter (interior) for a water closet trap. I find many of the closets of recent make contract the diameter of the trap to *three* inches or even less. While a pipe of this diameter has the advantage of more thorough scouring at every flushing and might prevent many things from entering the soil-pipe, which have no business there, would it not be liable to be clogged when large or stiff paper is used, especially in public places? On the other hand, if the diameter of the trap is too large, the body of water to be moved is heavier, the scouring less, and, where 3-inch soil-pipes are used, as is now occasionally seen, danger of obstruction therein is greater. For hopper closets should you consider 3½ a good dimension?

Yours respct'y, "SUBSCRIBER."

[As 4-inch seems to be the size of soil-pipe most used, it is desirable that the outlet of a hopper, or water closet, should not exceed 3½ inches. With good flushing, we do not apprehend any trouble from stoppage, even if the outlet is only 3 inches.]

CATCH BASINS.

LYNN, MASS., *Jan.* 11, 1883.

To the Editor of THE SANITARY ENGINEER:

Please inform me whether there is any effectual design (patented or otherwise) of catch basin that in its construction provides against the escape of sewer gas into the street without the aid of any external trap appliances, and oblige,

Yours very truly, W.

[We do not exactly understand what Mr. W. means by *external* trap appliances. There are catch basins in use with a water seal, and also with a flap or valve seal. The latter are more likely to get out of order, and when open, usually permit of an escape of sewer air, together with the water. The former, if made deep enough to prevent evaporation in hot weather, and if precaution is taken to prevent leakage by making the masonry water-tight, or by using cast-iron instead, do not become objectionable, and are nearly everywhere preferred. The particular shape and size of the catch basin depends on local conditions. We know of no patent which is an improvement over the catch basin used in the best sewered cities.]

LOSS OF PRESSURE.

PITTSBURGH, *Jan.* 9, 1883.

To the Editor of THE SANITARY ENGINEER:

Will you please give me some information in regard to loss of pressure in low pressure gravity apparatus. For illustration, having ten lbs. pressure at the boiler, at the extreme farthest point from boiler I only have eight lbs., a loss of two lbs. Now I am aware that the pressure is equalized by a column of water equal to 1 lb. of steam. Now, how high will this water of condensation be over the water line of boiler? Or in other words, what constitutes a pound pressure of water in height? Some say 27", others differ, so I come to you a leading authority. I am a steam fitter and would like to know this point as it is valuable to me.

One more point: will a radiator tube closed at the top work on a hot water job successfully, if not will a return bend radiator answer?

By answering the above either in the THE SANITARY ENGINEER or by mail you will oblige

Yours respectfully R. A. ORR.

[The 27" is approximately correct but to be exact the temperature of the water must be considered. For instance, when the temperature of the water is 40° Fah., $2\frac{8}{10}$ feet high will exert a pound pressure on a square inch, but should the water be 200 degrees, then it will require a height of $2\frac{41}{100}$ feet to have the same weight.

No vertical tube radiator will do well for hot water. Return bend *coils* are the best.

CALCULATING AMOUNT OF HEATING SURFACE.

ST. LOUIS, *Jan.* 8, 1883.

TO THE EDITOR OF *The Sanitary Engineer:*

1. Having the cubical contents of a room, how do you find the necessary square feet of radiating surface in steam coils (direct radiation) to heat said room to a given temperature, say 70° in a given time, say two hours?

2. What is the best proportion of square feet of heating surface in boiler to square feet of radiating surface in coils?

3. How do you estimate the consumption of coal necessary to warm a building when the heating surface in boiler is known; also the square feet of heating surface in coils. Cubical contents of building being known?

Respectfully,

A. H. GOFF.

[1. There are so many factors of unknown quantity to take into consideration that we shall not attempt to answer this question. A room which was warmed yesterday and cooled only during the night, would warm in a very much shorter time than if it was cold for a month, the walls and the materials of the walls having to be warmed first. Again, the result would be different for rooms with very large glass surfaces, with iron surfaces, with walls furred and not furred, and anything which will control the rapidity of circulation of the air will effect the time.

A pound of water cooled one degree will warm 48 cubic feet of air one degree; and if it were possible to keep the air first warmed by contact with the hot surfaces from cooling, until all the air in the room was warmed, the condensation of one pound of steam would warm 1,000 cubic feet of air about 50 degrees during the time it takes to condense.

Assumed, now, that the rapidity of condensation depends on the amount of surface, and that one square foot of pipe surface will condense ⅛ of a pound of water in an hour (a probable quantity for the circumstances), three square feet will warm 1,000 cubic feet of air in the hour; but on the other hand, should surrounding circumstances and natural circulation be equivalent to cooling the air four times in an hour, it will take 12 square feet of radiating surface to maintain the heat only, and about 15 square feet for the first hour, while warming up.

2. From 5 to 12 of radiator to one of boiler, according to circumstances.

3. A pound of coal *variously* burned in practice will evaporate from 6 to 10 times its own weight of water. If 100 square feet of radiating surface condense 33 pounds of steam in an hour, if your boiler is very good, you warm 100 square feet of radiator for the price of three pounds of coal per hour, which may vary to six pounds and more with poor apparatus.]

PRESSURE IN BOILERS.

OGDENSBURG, N. Y., *Jan.* 15, 1883.

TO THE EDITOR OF *The Sanitary Engineer:*

In a tubular boiler, with a pressure of 75 pounds of steam, is the pressure equal alike on all parts of the boiler, or is it greatest above or below water line? Please answer this through columns of your paper, to decide an argument and oblige a SUBSCRIBER.

[If to a boiler you attach two separate gauges, of sensitive construction and exactly alike, one on the top of the boiler and the other at the lowest point, the lower gauge will register the most. The difference between the gauges being one pound for about every two feet in perpendicular height of the water in the boiler.

The pressure is greatest at the bottom of the boiler, and the difference (always being the same) is *constant* whether steam is on the boiler or not.]

JOINTS ON IRON SOIL PIPES.

PHILADELPHIA, *Jan.* 15, 1883.

To the Editor of THE SANITARY ENGINEER:

"Subscriber" would find no difficulty in getting caulked joints to stand test, if he, or others, who complain of similar trouble, would use pure soft lead and good gaskets, and pour the lead, as hot as it can be, not burning the gasket, all with one heat, using, as you suggest, good soil pipes, with bells large and heavy enough to be properly caulked. The trouble is the pipe is too light and the joints too close, and many plumbers use old scrap lead; mixed with this is more or less hard metal; for packing they use old rags or paper. Those who use either of the above, bad pipes or bad lead and packing, must not complain if they do not have perfect work. The only way to get a good job is good material and good work, and you can apply as many tests as you choose. This is my experience after thirty-five years a plumber; it has never failed.

Yours very truly, JOHN WORTHINGTON.

1721 CHESTNUT ST.

UTICA, N. Y., *January* 17, 1883.

To the Editor of THE SANITARY ENGINEER:

In reply to yours, in number of SANITARY ENGINEER of January 11, for opinions of your readers in regard to lead caulked joints or flanges and bolts, as asked you by "Subscriber" of Boston, I would say that it is my opinion that for first-class plumbing work extra heavy cast iron pipe with rust joints is the best, and the only job that will stand water or air test. But as you rightly say, extra heavy cast iron pipe will stand caulking with lead perfectly tight if care is taken to do it. With properly mixed iron rust, it can be packed in where lead cannot be caulked, and will get tighter the longer it is in, so that in fact the soil pipe will lie as one piece. Light soil pipe will not stand the expansion of the joint. Truly yours, C. G D.

January 9, 1883.

I am informed that there is a system in use for pumping water for domestic purposes, the motive power of which is supplied by the kitchen range. I have seen no mention of it in your journal or elsewhere. If you know of such a system, perpaps others of your readers would be glad to have some particulars about it as well as B.

[Some years ago there was a pump that was operated in some such way as you suggest. We believe that it was called "Houghton's Pump." We are not aware that it is now in the market. If our readers know anything of it we shall be glad to hear from them].

PLUMBING LAW VIOLATION.

Several trivial and one serious case of violation of the plumbing law in this city, were reported last week.

THE JOURNEYMEN'S BALL.

The annual ball of the Brotherhood of New York Journeymen Plumbers of this city, took place at Irving Hall last evening. Occurring so late in our publication week we can only note that the committee of arrangements succeeded in making it as successful as the journeymen's gatherings always prove to be.

THE PROPOSED PLUMBING LAW OF THE STATE OF NEW JERSEY.

The following is the text of the bill introduced into the New Jersey Assembly, the 15th ult., for the registration of plumbers and the regulation of plumbing work in the cities and towns of New Jersey:

A Supplement to an act entitled "An Act concerning the protection of the public health, and the record of vital facts and statistics relating thereto," approved March eleventh, *Anno Domini* one thousand eight hundred and eighty.

1. *Be it enacted* by the Senate and General Assembly of the State of New Jersey, That on or before the first day of March, in the year eighteen hundred and eighty-three, every master or journeyman plumber carrying on his trade in any city, borough or incorporated town in this State, shall, under such rules and regulations as the Board of Health thereof shall prescribe, register his name and address at the office of the Board of Health of any such city, borough or incorporated town; and after the said date it shall not be lawful for any person to carry on the trade of plumbing in the said city, borough or incorporated town unless his name and address be registered as above prescribed.

2. *And be it enacted*, That the drainage and plumbing of all buildings, both public and private, hereafter erected, or constructed in buildings already erected, in any such city, borough or incorporated town, shall be executed in accordance with plans previously approved in writing by the Board of Health of any such city, borough or incorporated town; suitable drawings and description of the said plumbing and drainage shall in each case be submitted and placed on file in the office of said Board of Health; the said Board of Health is also authorized to receive and place on file drawings and descriptions of the plumbing and drainage of buildings erected prior to the passage of this act.

3. *And be it enacted*, That any person or persons violating any of the provisions of this act shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by a fine of fifty dollars for each offense.

4. *And be it enacted*, That this act shall be deemed a public act and shall take effect immediately.

A bill to levy a tax of one mill on the grand duplicate of Cincinnati for the construction of trunk sewers in that city has been introduced in the Ohio Legislature.

Food and Drugs.

PROSECUTIONS UNDER THE FOOD AND DRUG LAW.

The trial of grocers, charged by State Board of Health Inspector A. L. Colby, with selling adulterated food, was resumed at the Court of Special Sessions last Monday, the first case being that of Mrs. Anna Wedekind, of 1014 Second avenue, charged with selling adulterated mustard.

Counsel for the defendent moved to dismiss the complaint on the ground of uncertainty in the charge, "mustard" being applicable alike to the plant, the seed, and the preparation sold in the market; also that "flour," the alleged adulterant, was an indefinite term, and read the records of numerous cases in which the court had held similar charges indefinite and informal, and dismissed the complaint. This motion was denied.

The first witness was Mr. A. L. Colby, the Inspector of the State Board of Health, who testified that he purchased the sample of the defendant and on examination of a portion of it by chemical test and by microscope, found a considerable quantity of wheat starch in it from which he inferred that flour was mixed with the mustard.

Dr. E. G. Love, Analyst of the State Board of Health, testified that he had received from Inspector Colby a portion of the same sample and found on analysis that it contained beside mustard, wheat flour, ground gypsum and turmeric. The amount of starch found was 21.1 per cent. and as that constituted only about two-thirds of wheat flour, the mustard contained from thirty to forty per cent. of flour.

The manufacturer of the mustard, who was next called as a witness by the defense, admitted frankly that this percentage of flour was mixed with the mustard, claiming that the pure mustard flour was too strong for ordinary use, but denied having ever used ground gypsum.

Defendant's counsel then moved to dismiss the complaint on the ground that mustard was not food, but a condiment; that there was no intent on the part of his client to sell an adulterated article, and that the statute prohibiting such mixtures was unconstitutional. These motions were denied by the court, the defendant found guilty and sentenced to pay a nominal fine of $10.

George Bairn, Sr., owner of "Bairn's Tea Company, 981 Second avenue, and also of fourteen other stores, was next called and charged with selling coffee adulterated with 10 per cent. of chicory and also burned peas. He plead guilty and was fined $10. He now lables all packages containing mixtures with the names of the constituents. Owing to the large number of prisoners awaiting trial, the remaining cases were put over.

RULINGS OF THE STATE BOARD OF HEATH WITH REGARD TO MIXTURES.

The New York State Board of Health, at a recent special meeting, adopted the following resolutions which await the Governor's signature before going into effect.

"*Resolved*—That under and pursuant to Section 4, of Chapter 407, of the Laws of 1881, the following mixtures, when distinctly labeled in the manner provided in subdivision 7 of Sectiou 3 of said Act, are, within the conditions hereinafter prescribed, declared to be exempt and permitted to be sold under the provisions of the said Act.

"1. *Coffee and chickory mixture*, to which no other substance or article is added, and in which mixture pure coffee shall not be less than fifty per cent. of the whole compound or mixture.

"2. *Mustard and wheat or rice flour mixture*, to which no other substance or article, or any coloring matter is added, and in which mixture pure mustard shall not be less than fifty per cent. of the whole compound or mixture.

"The labels on the above mixtures shall be plainly and distinctly marked in letters of the same size as in the whole name of the mixture, so as to be read on one side of the parcel or package containing the mixture, in whatever quantity the same be sold, and the *proportions* of the two above designated *parts* of the said mixtures, shall in each case be distinctly marked and published on the said labels.

"*Resolved*—That under and pursuant to Section 4, of Chapter 407 of the Laws of 1881, the State Board of Health hereby fixes the limit of the variability permissible in cider vinegar, which shall not contain less than five per cent. of pure acetic acid, and shall not leave on evaporation less than one and one-half per cent. of solid matters, the same being weighed after drying as 212° Fahr.

"*Resolved*—That having considered other applications besides those for coffee and chicory mixtures, for mustard and flour mixtures, and for a standard of vinegar, the Board deems it inexpedient *at present* to authorize any other mixtures or fix any other standards, under Section 84, of Chapter 407, of the Laws of 1881."

SANITARY WORK IN NEW YORK.

SECOND ANNUAL REPORT OF THE STATE BOARD OF HEALTH OF NEW YORK. Albany, 1882.

This is a handsome volume of 726 octavo pages, 48 of which are occupied by the report of the Board and the remainder by appended documents.

The report of the Board consists mainly of a summary of the appended reports. It makes no definite and precise recommendations to the Governor and Legislature, takes a rose-colored view of the situation, has no word of blame for any one, and appears to be abundantly satisfied with everything and everybody. It tells us that "The constituted local authorites of towns and villages are evincing their worthiness of the trust which successive Legislatures repose in them." The organized townships and cities being the units of which the State is composed, there is abundant reason for testing the willingness and ability of local sanitary authorities to perform the duties now required at their hands under the existing laws relating to the public health and vital registration. Without hesitation the State Board of Health has thus far endeavored to take all possible advantage of these laws in their obvious meaning, and of the best provisions of the local government organizations as found at the time available in the towns, cities, and villages, for giving practical effect to their laws, so far as this Board may participate in, or usefully influence the administration and execution of them."

It will be seen that this has the flavor of glucose rather than of acid or spice, and no doubt the local authorities will be pleased and surprised to learn of their efficiency, more so, in fact, than many of the people who have suffered from their ignorance and devotion to political, rather than to sanitary interests. We should have thought it worth while for the Board to have published a list or table of the local health authorities of the State which are actually organized and doing something for sanitary improvement, and we hope this information will be given in the next report.

With regard to the State system of registration of births, marriages and deaths, we are told that it is doing well and that "947 towns, 326 incorporated villages, and 18 cities have been provided with methods of vital registration." We should like to see a list of these towns, villages and cities, a statement of the number of births, deaths and marriages which they have recorded and reported, and also a list of those towns, villages and cities which are not keeping such records. The Board seems to be fearful of being specific in its statements, of mentioning names, of giving offense to any person or corporation; it speaks with bated breath, as it were, and in a vague and non-committal way—of any imperfections in the work of local authorities. For example, it says, "It is not improbable that the complete reorganization of local Boards of Health throughout the State, will insure the operation of all the necessary agencies and influences for complete as well as accurate registry in every community." The complete reorganization of Local Boards of Health throughout the State would, no doubt, effect much, but it seems to us that what it would effect depends a good deal on the nature of the reorganization.

As a matter of fact, we believe the report does not do the Board justice. It has really done a great deal of good work. The Secretary, Dr. Harris, has been a sanitary missionary among the smaller towns and villages, and it is to his personal visits, explanations and persuasions, that the existence of a large number of the present local health authorities is due. The selection of inspectors for special work, such as for the examination of malarious localities, inspectors of schools, etc., has been well made, and the reports from these inspectors given in the appendix, are of more than local interest. We commend especially the reports by Dr. A. S. Carroll, and Dr. Lincoln.

The reports of work under the Adulteration of Food and Drugs Act, take up more than 200 pages of the appendix, and have already been noticed.

Most of the other reports in the appendix have already appeared separately, and been noticed in this journal.

The volume is one that will be found interesting and useful by all sanitarians, and, as it becomes known, the demand for copies is likely to be large.

ANNUAL MEETING OF THE ILLINOIS STATE BOARD OF HEALTH.

The regular annual meeting of the Illinois State Board of Health was held at Springfield, Ill., Jan, 11 and 12, 1883.

The greater part of the session was occupied with the discussion of questions relating to Medical Education and the Working of the Medical Practice Act. The quarterly report of the Secretary, Dr. Rauch, was submitted, giving a summary of his monthly reports to the National Board on the immigrant inspection service. Resolutions were adopted endorsing the National Board of Health, as follows:

"WHEREAS, The act of Congress, approved June 2, 1879, by which the National Board of Health is charged with the duty of coöperating with and aiding State and local boards of health in the enforcement of their rules and regulations to prevent the introduction of contagious and infectious diseases into the United States, and into one State from another, will expire by limitation on the first of June, proximo: and

WHEREAS, The said National Board of Health has discharged this duty with so much of success, honesty of purpose and regard to economy—the specific details of its work being briefly summarized in the appended memorandum—as to conclusively demonstrate the value of a National agency for the protection of the public health; therefore, be it

Resolved, That the Illinois State Board of Health earnestly urges upon the Senators and Representatives from this State to obtain, during the present session, the legislation necessary to secure an extention of said act, pending the creation of a permanent National Health organization—such legislation to include a provision whereby the unexpended balances of the original appropriations may be reappropriated and made immediately available for the purposes of said act.

Resolved, That the Secretary be, and he hereby is, authorized to transmit a copy of this preamble, resolutions, and appended summary to each Senator and Representative from this State."

The election of officers for the coming year resulted as follows: President, the Hon, Newton Bateman, L.L.D., of Galesburg; Secretary, John H. Rauch, M.D., of Chicago; Treasurer, A. L. Clark, M.D., of Elgin.

The general feeling of satisfaction with the work of this Board is very well expressed in the following passage from the Governor's recent message:

"At the time of the organization of the Board of Health there were doubts in the minds of many good people as to its necessity, and for a time, much prejudice against its work. The doubts and prejudices, however, have gradually given way, as the Board has fearlessly and with prudence gone forward in the discharge of the work before it, until I think there is now an almost universal conviction that its services in protecting the people from contagious diseases and from the evils caused by ignorance and charlatanry in the practice of medicine, as well as the general sanitary work of the Board, cannot be dispensed with. The acts creating this Board and conferring its powers would have proved a deal better if not enforced, as they have been, by a competent and determined executive agency; and it will be a gratification to the people of Illinois to know that in their enforcement the State Board of Health has exerted an influence which has been felt throughout the country in various ways; in the elevation of the standard of medical education, the suppression of fraudulent medical colleges, and the introduction of improved methods of establishing and maintaining an effective quarantine against infectious diseases, *their* services have done much to add to the reputation of our State at home and abroad."

ANNUAL CONTRACTS WITH PHYSICIANS.

CHAMPAIGN, ILL., *Jan.* 16, 1883.

To the Editor of THE SANITARY ENGINEER:

The suggestion of Dr. Phillips, as to employment of physicians by annual contract at a specified rate is an excellent one (page 131, Jan. 11, 1882).

But it is my impression, that a physician would not be permitted to make such an agreement, by the county and State medical societies.

Can you give infomation as to the correctness of this opinion? Yours truly,

N. CLIFFORD RICKER.

[Our correspondent's opinion is no doubt correct, and it was in view of this fact, that we remarked upon Dr. Phillip's proposition that we doubted whether physicians of good repute would be willing to make such a contract. It would be considered as offering to do work cheaper than other physicians, a sort of underbidding for practice which is considered to be ungentlemanly, or as the physicians would say, contrary to ethics. If the medical societies took the matter up and fixed the terms and conditions, it would of course do away with this objection.]

LEPROSY AND THE MEANS TAKEN TO PREVENT ITS SPREAD AT MARACAIBO.

We have received from the National Board of Health, a copy of a report transmitted to it through the Department of State, by Mr. E. H. Plumachee, U. S. Consul at Maracaibo, relating to the leper hospital or lazaretto, established on an island near Maracaibo, in Venezuela, from which we give the following extracts:

"Although it is more probable that elephantiasis has existed in this country from a remote period, it is claimed by native authorities that until 1825 this section was free from this social scourge, and that in that year a native of Santo Domingo, suffering with the disease, landed at Maracaibo and spread the infection until it has finally culminated in a serious social problem.

"In 1828 the growing evil of leprosy attracted the attention of the more thoughtful, and the initiative was taken in this section by the renting of an island in the lake situated about four miles south of Maracaibo. * * *

"It was not until 1876, however, that a movement was fairly inaugurated, deserving unlimited praise, and which has continued with constant zeal and energy to the present day.

"At that period various ladies of Maracaibo set seriously to work to secure funds for the amelioration of the condition of these unfortunates, and for the vigorous prosecution of the task of apprehending and isolating in the lazaretto the cases of disease still at large, which had then assumed alarming numbers, such as to seriously endanger the sanitary future of this section. * * *

"Both in this country and in Columbia, leprosy is encountered in all its modifications, from the slight discoloration of the skin to the most horrible forms of mutilation, and the record of the various modes of treatment and their results, may be studied with much interest by the faculty.

"My visits to the island have much impressed me with its suitability, and the system in vogue cannot be too highly commended. The locality is designated the 'Isla de la Providencia,' is situated about four miles south of the city and enjoys a fresher and much more agreeable climate than Maracaibo itself. At present there are but about one hnndred and twenty-five patients under treatment, although it is believed that there are at least four hundred still at large in the city and its environs, who are being apprehended as rapidly as possible with the limited resources at the disposal of the Junta, who as yet have a certain income of only about twelve hundred dollars monthly.

"It was at first a mooted point as to whether marriages should be permitted among the patients, and after a lengthy investigation and discussion, it was finially determined that past experience warranted the almost certain belief tht such unions would prove unfruitful, and consequently several weddings have taken place, while others are in anticipation. It should be here mentioned that pregnancy has not as yet resulted in any of these cases, and should the theory of sterility be correct, it seems laudable on the part of the governing body to allow this alleviation of their woes to be extended to the wretched creatures under their care.

"The experiment, however, can only be made when both parties are lepers, as a union between a sound and a diseased person would almost infallibly result in the propagation of diseased offspring.

"The result of these marriages has been to induce more cheerfulness and resignation, and to add greatly to the good discipline of the institution. * * *

"The disease assumes various phases, the most common type being the tuberculous, manifested in distorted features, enormous pendant ears and lips and an abundance of exaggerated wrinkles. I have seen children of both sexes, of twelve or fourteen years of age, with the features and bearing of octogenarians, and the saddest cases that came under my notice were of this class. In persons of more advanced age, blindness and mutilation of the extremities are common.

"Fingers and toes drop off, or are peeled by off the patients themselves, without pain or loss of blood. In other cases the body is a mass of scales, or, perpaps, almost an entire ulcer.

"Opinions differ as to the possibility of radically curing the disease, but I regret to say that the records of this asylum give but little encouragement to the optimist. No authenticated report of absolute cure of a properly diagnosed case of leprosy can be cited during the fifty-four years of existence of the Maracaibo lazaretto.

"The present Secretary of Government, a physician of high standing, and who has received a European medical education, in a communication to the Junta, lays stress upon the arsenical treatment, not with a view to an ultimate cure, but simply as an alleviation.

"He takes the ground of the incurability of the disease, and inclines to the French theory of the medullar origin of leprosy as opposed to the German idea of its parasitical character.

"Here experience seems to demonstrate the correctness of the former theory, as, were the disease parasitical, it would no doubt be contagious, the reverse of which has been observed in this country.

"There is at present at the lazaretto a case in point, which speaks emphatically againt the possibility of the disease being spread by contact.

"About seventeen years ago, a woman was admitted, who has ever since suffered with elephantiasis of the most marked character. She was accompanied by her daughter, a child three years of age, who has ever since resided on the island, in daily intercourse with her mother, and who is now her constant attendant. This young woman, now twenty years of age, has as yet no symptoms whatever of disease, having a perfectly clear cuticle and complexion, and being in all respects in a normal condition, with very attractive features.

"It is very possible that she also may be ultimately afflicted, but if so, it will be from hereditary taint, and not from contagion.

"Other examples, more or less similar, could be cited, but this one will serve to sustain the theory." * * *

We have quoted somewhat fully from this report which is possibly a timely warning to this country. We have Leprosy in the United States at least three points, viz.: the Pacific Coast, Louisiana, and in the Northwest brought by Scandinavian immigration. The opinion of Mr. Plumachee that it is not contagious can only be sustained by making a special definition of the word "contagious" to suit the case. He says that in 1825 it was introduced into Maracaibo from the West Indies and in 1828, only three years after, was recognized as a growing evil.

How then had it spread? It could not be by heredity for children under five very rarely show it. The case which he relates proves nothing whatever except that a person having the hereditary taint is not endangered by contact which is very probable.

The best authorities insist on the importance of isolation and the prohibition of the immigration of lepers, and it is certainly common prudence on the part of communities to carry out these recommendations.

THE NORTH CAROLINA STATE BOARD OF HEALTH.

We are indebted to Dr. Thomas F. Wood of Wilmington, editor ofthe *North Carolina Medical Journal*, for the following report of the Conference of the State Board of Health of North Carolina, with the County Superintendents of Health at Raleigh, the 9th ult.

CONFERENCE OF THE STATE BOARD OF HEALTH WITH THE COUNTY SUPERINTENDENTS OF HEALTH AT THE CAPITAL.

Responding to a call sent out by the State Board of Health, and published in the *Journal* of December, a number of representatives of both bodies met at the Yarborough House, on Tuesday the 9th inst. The State Board was represented by Prof. Simmons, of Wake Forest, Dr. Geo. A. Foote, of Warrenton, and the Secretary of the Board. Superintendents of Health from several counties were present, as follows: Dr. J. M. Stansill, from Richmond County; Dr. J. E. Green, from Halifax; Dr, Geo. A. Foote, of Warren (who is also a Superintendent of Health and member of the State Board), Dr. W. T. Ennett, of Pender; Dr. James McKee, of Wake; Dr. J. J, Summerell, of Rowan; Dr. J. D. Roberts, of Wayne; Dr. J. W. Jones, of Wake Forest; Dr. J. G. Ramsey, of Rowan; Dr. C. Thompson, of Onslow; and subsequently Dr. Turner, of Moore, and Dr. Beall, of Davidson, were present.

Dr. Summerell, of Salisbury was appointed Chairman and Dr. J. D. Roberts Secretary.

The matters for consideration by the conference were explained by the Secretary of the State Board, as follows:

The amendments required to make the present law operative, could be briefly stated. The Governor in his message called the attention of the General Assembly to the fact, that although the Constitution of the State required the formation of a Board of Charities and Correction, the law had not been complied with, and that practically no such Board existed. The Board of Health had been working out the problem under the law.

The Governor had shown a true appreciation of the service the Board of Health had rendered the State, in suggesting a coalescence of the two laws. He saw in the Board of Health the elements necessary to success, and in it a hope for the future of the constitutional requirements as regards the sanitary condition of the charitable and penal institutions of the State. The original law had been put in the hands of Dr. C. Tate Murphy, a former State Senator, and Chairman of the Board of Charities and Correction, but upon his withdrawal from the public service, the whole work had fallen into desuetude. Dr. Murphy had also been an ardent supporter of the State Board of Health, until his failing health ended his career.

We do not forget that in the State of Massachusetts, the Board of Health of that State, had been merged into the Board of Public Charities, thereby impeding the work; but that State did not have an organization like ours. There was no good ground upon which detriment to our Board of Health could be prognosticated, by a future merging into the Board of Charities and Corrections. For was it not true that the State Board by aid of its auxiliary county boards had already taken up the work of the sanitary supervision of the jails, work houses and poor houses of the State? The State Board is on record in its "First Biennial Report," showing with how much care the work has been done, making a very strong and favorab e contrast with the unorganized work of the Board of Charities and Corrections, until the State Board of Health had demonstrated the practical working of a dead law, so that the North Carolina Board of Health really had nothing to fear of a coalescence which had been unconsciously in existence several years.

After this explanation by the Secretary, a committee was appointed to make a new draft of the law, incorporating the amendments proposed in the Governor's message.

The substance of the proposed law is as follows:

1. The State Board of Health to assume all the duties set forth in the law creating the Board of Charities and Corrections.

2. The composition of the Board to remain as at present.

3. The State Board to take cognizance of the health interests of the State, making all investigations necessary to obtain information about the introduction and progress of epidemics; to be sanitary advisers of the State; to make inspection of State institutions; to pursue special studies appertaining to their work, and when necessary to call in the assistance of experts.

4. The members to be elected and appointed as formerly.

5. The officers of the Board to be a President, Secretary, and Treasurer, the Secretary to receive such compensation as the Board may allow.

6. The auxiliary County Boards to remain as at present, and their duties to be as prescribed by law, and their salary to be left to the county and town authorities, but to be based upon the fees current in the county in which a Superintendent serves.

7. Directs the time of meeting of the State Board.

8. Provides for monthly reports of Superintendents to the Secretary of the State Board.

9. Refers to the conduct of inland quarantine, making the fine for its violation $200, and enjoining upon Superintendents to give all aid in their power to the maritime quarantine.

10. Directs the process for the abatement of nuisances dangerous to the public health.

11. Provides for the proper vaccination of persons coming under the care of the State and Counties; provides for a supply of vaccine to be kept by the Secretary; and asks for $200 for this purpose.

12. Provides for issue of Bulletins of warning, on matters appertaining to pestilential disease, and the means of preventing their spread; also provides for the circulation of information upon all topics which in the discretion of the Board affect the health interests of the people.

13. About special meetings of the Board.

14. Provides for analyses of water, food, drugs, etc., by the Agricultural Department.

15. Asking the State for $3,000 annual appropriation, and printing, and stationery necessary.

16. Repealing all laws conflicting with this.

The discussion of all the items entering into this bill was prolonged and earnest, and the final conclusion of the work reached, was left to the consideration of the friends of the Board in the Senate and House of Representatives.

We trust our efforts to the General Assembly with more confidence than heretofore, and we believe the prospects are good for a successful issue of our labor.

THE IMMIGRANT INSPECTION SERVICE.

The final report of Dr. J. H. Rauch to the National oard of Health, dated Jan. 10, 1883, gives a summary of the work performed during the season, from June 1 to Dec. 1, 1882. The total number of immigrants inspected during this time was 115,057, of which 21,618 were vaccinated by the inspectors; 3,242 of these were primary vaccinations, that is, were performed in cases which had never been successfully vaccinated, and were, therefore, entirely unprotected. Of the whole number inspected 57,302 were found to have been satisfactorily vaccinated before sailing or during the voyage, 3,127 had had smallpox, and 28,408 had been vaccinated at seabord quarantines.

The proportion of those vaccinated or re-vaccinated on shipboard rose from 22 to 29 in the hundred for the season; but the proportion of effective vaccinations on shipboard remained substantially the same—being a little under eight per 100 of the total number inspected in June, July and August, and a fraction of eight per 100 for the entire season. Of these ship-vaccinations about four in every 100 produced modified, and 24 in every 100 produced typical cicatrices; the remaining 72 per cent. were total failures.

The evidence presented as to the importance of this service should certainly be sufficient to ensure its continuance for the coming year.

Defective flues cause more fires in winter than anything else. But this is no reason why houses should be without flues. Yet that would be the logical sequence of the argument urged against sewers—that sewers are bad things, because, when defective, they leak sewer gas.—*Trenton State Gazette.*

Novelties.

Under this heading we propose to supplement our section on patents by descriptions and illustrations of new appliances put on the market. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity and probable interest to readers, and especially the fact that they have not been elsewhere described As a rule we shall make no comments, and IT IS TO BE DISTINCTLY UNDERSTOOD THAT A NOTICE DOES NOT IMPLY APPROVAL. *No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.*

APPARATUS FOR FEEDING LIQUIDS AGAINST PRESSURE.

The apparatus illustrated and described below is the invention of Wm. W. Rosenfield, a youth of seventeen and resident of this city. Its practical application thus far has been confined chiefly to the vaporizing apparatus of

FIGURE 1.

the same inventor, in which it serves to admit liquid drugs to the hot water about to be vaporized by issuing from minute perforations in a tube, for the purpose of giving medicated baths, disinfecting, etc. It is claimed to work equally well as a lubricator, for feeding oil against steam

FIGURE 2.

pressure, but we shall consider only its application to the former apparatus, as manufactured by the Portable Hygienic Vapor and Disinfector Company, of 40 Spruce street, this city.

Figure 1 represents the combined apparatus for the production of medicated vapor as connected with a bath tub. Rubber tubes attached to the hot and cold water taps unite and enter the bottom of a hollow brass cylinder, about three inches in diameter and seven inches high, called the "air chamber." Above this is the apparatus for feeding liquid drugs into the water, which will be described presently. The water will compress the air in the air chamber and rise to a height depending on the head of water, but never filling the chamber so long as it remains air-tight, as it is intended to be. Thence, the water passes into a smaller cylinder beside the air chamber, provided for the reception of solid drugs (to be dissolved by the passing water) which are placed in a perforated inner cylinder by unscrewing the cover.

Figure 2 is a vertical section, on a larger scale, of the feeding apparatus, of a slightly different form from that shown in Fig. 1, but essentially the same. It consists, in brief, of a glass cup, *A*, for holding the liquid to be fed into the water, with a metal cover, *B*, both of which are held down to the casting, *C*, by a metal pipe, *D*, threaded at both ends; a small air-tube, *E*, through the casting *C*, extended by the pipe *F* nearly to the top of cup *A*, and another tube, *G*, through which the liquid passes down, its flow being regulated by the stop *H*. The liquid is introduced into the cup through an opening in the centre of the cover closed by the plug *j*. It falls directly into the pipe *D*, from which it passes out into the cup through holes (*k k*) near the bottom. The tube *E*, extended to above the surface of the liquid by the pipe *F*, allows the air from the air chamber to rise into the space above the liquid in the cup and restore the air above to the same density as that below, and thus offer no resistance to the flow of the liquid. The lower portion of the casting *C* is hollow with a thick glass lining, *m*, and has in opposite sides "peep holes," *l l*, to enable the attendant to see how fast the liquid is running. Washers, *n n*, of some vegetable preparation, are placed between the ends of the glass and the metal, to make air-tight joints.

Construction Notes.

GRANBY, QUEBEC.—The Council on Jan. 13, favorably considered the plan for water works proposed by Mr. Bourke. It contemplates bringing the water from Shefford Mountain, a distance of about five miles.

PHILADELPHIA.—At a meeting of Council on Jan. 24, an ordinance was presented relative to street paving. It provides that the Mayor shall obtain from the American Society of Civil Engineers, the Engineer Corps of the United States Army, and the Franklin Institute, the names of six engineers, and from these six names the Mayor to select three who shall constitute a Board of Experts to make a thorough and exhaustive report as to the best pavement for large cities.

A request has been presented to the Council that $125,000 of the surplus fund should be appropriated for constructing a bridge across the Philadelphia and Reading Railroad at Thompson street. The request was referred to the Finance Committee.

GLOUCESTER CITY, N. J.—Proposals will be received by the Mayor and Common Council until Feb. 13, for furnishing labor and materials for constructing water works.

TORONTO, CANADA.—The city council have accepted the bid of the Lander & Thorton manufacturing company for furnishing valves for the water works.

WORCESTER, Mass.—The council has voted to take Talmuck Brook, one of the tributaries of the Blackstone River, for an additional water supply. The stream will furnish twice as much water as is now available from the present sources. The cost will be from $300,000 to $400,000.—*Engineering News.*

PRINCETON, N. J.—The water company have made contracts with the Warren Foundry and Machine Company, for cast iron water pipe, with Tippett & Wood of Phillipsburgh, for the erection of an iron tank 20 feet in diameter and 60 feet high, on a trestle 60 feet high, and with the Eddy Valve Co., for gates and fire hydrants. The construction of the supply well and engine house and the laying of the mains will be advertised in a few days. The work is in charge of J. J. R. Croes.

CHICAGO.—The Comptroller's estimates for the year are just announced. They include provision for new bridges at State and Eighteenth streets, a new viaduct at Erie street, and for the completion of the canal pumping works. The totals are: for Department of Public Works, $1,202,874.81; for sewerage maintenance, $94,266.66; for sewerage construction, $245,513.61; for new City Hall, $90,718.73; a grand total of $1,633,373.81.

CHARLESTON, W. VA.—Bids for heating apparatus for the Court House were opened at the Treasury Department, Washington, the 24th ult, as follows: Kelly & Jones, $7,637; Bartlett, Hayward & Co., $7,948; Reuter & Mallory, $10,200.

BROOKLYN.—The contract for furnishing pipe and special castings for the Eastern District water main has been awarded to Mellert & Co., of Reading (Pa.) Iron Works, and to A. H. McNeill & Co., of Burlington, N. J., for $140,000.

WILMINGTON, DEL.—The Sewer Committee of Councils has engaged Mr. Rudolph Hering to examine into the feasibility of establishing a sewerage system. Mr. Hering's report will be submitted in a week or ten days.

ZANESVILLE, O.—A survey of the Zanesville, O., water works system is being made by Dr. Claude Martin.

CHICAGO.—The Detroit Bridge and Iron Works Company was awarded, Jan. 24, the contract for building an iron swing-bridge across the South Ward at Ashland avenue, at $10,500. The other bidders were: Kupers & Riddell, for $13,940; Delaware Bridge Co., $12,730 (for combined bridge, $35,980); King Iron Bridge Co., $13,875 (combined, $37,950); Roust & Coolidge, $11,695 (combined $32,440).

BOSTON.—Mr. William H. Bradley, Superintendant of Sewers, presented his annual report to the aldermen the 22d ult., which shows that the amount expended the past year was $243,195. There were built in the city proper, 8,001 feet, and in the suburbs about 30,000 feet of sewers. The total length, excluding the intercepting sewer, is about 204 miles.

Street Cleaning Commissioner Coleman after consultation with Mr. Andrews, counsel for the Corporation, has decided to appeal to the upper court from the decision of Judge Van Brunt continuing the injunction restraining him from awarding the contract for the removal of street refuse to the lowest bidder.

NEWPORT WATER SUPPLY.

The Water Company of Newport, Rhode Island, made application to the Supreme Court of that State for the condemnation of land adjoining the Company's storage reservoir, to an extent sufficient to admit of raising the dam three feet, and flooding such lands. The owners of the adjacent property objected to the raising of the pond, on the ground that sufficient storage capacity already existed for the wants of Newport for some time to come, that the quality of the water furnished from that source is now bad, and that it would be rather deteriorated than improved by the flooding of a large additional area of flat ground covered with a rich soil, that the risk of disease to the riparian dwellers would be greatly increased by the approach of the line of saturation in the soil several hundred feet nearer to their houses, and that even if it were necessary to increase the storage capacity in that pond, the desired object could be attained with less expense, greater security against pollution of the water, less detriment to surrounding property and probably at less expense, by deepening the existing pond, by excavating the shallow portions and placing the material removed on the banks. If still more room was needed it was asserted that it might be obtained by enclosing with a dam an area of land under water adjoining the present pond, and which had been given by the City of Newport to George H. Norman, the builder and principal owner of the waterworks.

The expert testimony covering these points was given by George E. Waring, C. E., J. J. R. Croes, C. E., and E. W. Bowditch, C. E.

The Water Company called Alphose Fteley, C. E., and George H. Bishop, C. E., and Mr. Norman, to show that more storage capacity was needed, and that it was not customary in making storage reservoirs to excavate the bottom in shallow places, and that it would be very expensive to deepen the present basin by digging out parts of its bottom or to build another basin adjoining it, while the existing dam could be raised three feet at a cost of $10,000. To meet the testimony of Mr. Bowditch as to the bad quality of the water shown by analysis made by Dr. Smart

Digitized by Google

for the National Board of Health, the Company had a glass of the Newport water poured out and handed to a witness who smelt and tasted it, and said it was good.

The Court granted the application of the Water Company, on the ground that the opponents of the application had not presented any plan which would cost less than that advocated by the Company. No attention was paid by the Court to the very decided statements of the experts as to the bad effect on the water of the large expanse of shallow water over mud flats on which there is now growing grass and cat-tails, and the additional detriment which the extension of the shallow pond would be over the expanse of highly manured and cultivated land proposed to be covered.

THE POLLUTION OF THE SCHUYLKILL.

Under date of January 13, 1883, Russell Thayer, C.E., Superintendent of Fairmount Park, reported to the Park Commission of Philadelphia that the impurities of the Schuylkill water was caused by tar and oil, discharged into the river at Manayuuk from the Gas Works, the bleach water from Paper Mills, the gas waste at Norristown and Reading, and the sewage of those towns, and Conshohocken, Pottstown and Phœnixville. He advises that efforts be made to have the Legislature pass a law creating a commission empowered to keep the rivers of Pennsylvania free from pollutions of this class, and thinks that the construction of intercepting sewers along the river front of the city, the completion of the East Park Reservoir and the possibility of filtering the water supply should be considered.

CINCINNATI'S SEWERAGE.

[From our Special Correspondent.]

The general statement can be made in regard to the sewerage of Cincinnati that "there is not a ward with perfect drainage facilities in the city. The construction of sewers for the most part is good, but they are not sufficiently extended or connected to effect a perfect drainage of any portion the city. The effect of acids upon limestone, and the want of durability in brick, as shown by the frequency with which small sewers are required to be taken up, it not being possible otherwise to repair them, led the city engineer to recommend the use of granite as more economical for inverts, curbs, catch basins and drips. The total length of sewers is about 48 miles, giving 20,000 available connections. And plans have been approved for 22 miles more. One of the strongest evidences of public indifference to the sanitary advantages of sewers is seen in the fact that thus far only 3,709 connections have been made, of which 362 were made the past year.

The plumbers of Cincinnati, so far as can be ascertained, have not attempted by any means of ventilating pipes or traps to make any provision against the entrance of sewer gas into dwellings, relying entirely upon the sewer ventilation which is effected by perforated manhole covers placed 150 feet apart. Besides, the grades discharged rapidly, and the trunk sewers are open at the ends. The old sewer outlets, however, into the river are submerged during a great portion of the year.

The new form of charter proposed for cities in Tennessee, by the Citizens' Reform Association, of Nashville, contains some unusual provisions. The council are forbidden "to make any appropriation of money or credit in the way of donations, festivities, pageants, processions or parades." Ordinances passed by the City Council shall not take effect until twenty days after such passage, unless they contain at the end of the ordinance the words, "this ordinance shall take effect from and after its passage, the welfare of the city requiring it." A "board of public works and affairs" is provided for, composed of three freeholders elected by the city council, and shall "devote their time and attention to the duties of their office and shall not engage actively in another business." The members of this board and all persons elected, employed, appointed or contracted with by them, are required to be persons who are not "related to the Mayor or any alderman or any member of the board, within the sixth degree of consanquinity under the civil law."

Fires in London during the week ending Dec. 18, were 46, as follows: Causes unknown, 21; defect in flue, five; hot ashes, four; spark from fire, two; spirit lamp upset, two; and the following causes one each: clothes in contact with fire, overheat of flue, blocked up flue, oil lamp, cork dust falling on gas light, seeking an escape of gas with a light, candle, stove improperly set, overheat of furnace, vapor of spirits in contact with flame, children playing with fire, goods in contact with gas light. Fifty-six properties in the occupation of 66 tenants, were injured.

A panic was created in a Philadelphia school house the other day by an alarm of fire. The only means of egress from the school rooms was by a long narrow stairway, and several of the children were injured while trying to escape down it. Others attempted to jump from windows but were prevented.

ALTERATIONS, NEW YORK CITY.

Broadway, No. 53, add one st, interior alterations throughout, new st of iron; cost, 30,000 o, R. Goelet; a, J. M. Dunn; b, day's work ....Grand st, Nos. 85 and 87, br exten, cost, $30,000; o, Joseph Fisher; a, W. H. Hume; b, not selected...10th av, No. 723 front alt, iron work, also, first st par alt, cost, $2,500; o, D. Kniokmann; a, A. Pfund & Son....1st av, No. 434, new walls and foundations on n and e sides; cost; $2,500; o, Carl H. Schultz; a, E. E. Raht; masons, R. L. Darragh & Co.; car, not selected....5th av, No. 78 first st lowered, iron work, cost, $10,000; o, George Hillen; a, W. H. Hume, b, not selected....59th st, No. 139 E, br ex, cost, $8,000; o, Patrick H. McCaffrey; a, Jas. Barrett....32d st, No. 438, repair damage by fire, cost, ——; o, James Thompson; a, H. J. Schwarzmann & Co.....2d av, No. 468, raised one st, and br ex, int alt; cost, $4,500; o, Charles Bernhardt; a, Wm. Jose....Ganesvoort st, No. 50, add one st, int remod. front alt; cost, $2,000; o, Hermann G. Mohlmann; a, Wm. Graul.

San Francisco, Cal.—Sutter cor Polk, br bldg; cost abt $100,000; o, Sutter St. R. R. Co.; a, Kentizer & Raun; c, Mahoney Bros.... California cor Broderick, frame; cost $28,000; o, C. Blethen; a, G. E. Voelkel; c, Conrad & Miller....Steiner, x Pine and California, frame; cost $7,500; o. W. Trost; a, G. E. Voelkel; c, P. Laherty....Hyde nr Ellis, frame; cost $6,000; o, O. Dinsmore; a, Schmidt & Havens; c, Haskell & White....Sansome nr Jackson, br house; cost $5,000; o, Novello & Pitto; c, Novello.. . McAlister, nr Scott, frame; cost $20,000, o, C. Lind; a, Wright & Sanders; c, A. Flood....Sutter, nr Taylor, frame; cost abt $40,000; o, Mrs. Renton; a, C. Geddes; c, W, E. Stevens; car, Grant... Market, x 18th and 19th, frame; cost $6,000; o, Dr. Miller; a, H. D. Mitchell; c, F. W. Kern....Shotwell, x 22d and 23d, two tanks and frame; cost $7,000; o, Landers; c, Treadwell....Fulton, nr Polk, frame; cost $5,000; o, College of Pharmacy; a, Percy & Hamilton; c, W. M. Fletcher....Clay, nr Gough, frame cost $20,000; o, W. S. Wood; a, A. Laver; c, J. T. O'Brien.

Alterations.—Taylor, near Turk, raising and additions; cost $10,000; o, Mejasson; a, Huerne & Elliott; c, W. B. Kreger..... Franklin and McAlister, additions; cost $5,000; o, U. S. Brewery; a, H. Geilfuss; c, Fuchs & Hewe....Pine, cor Stockton, repairs to dwell; cost $30,000; o, S. Wilson; a, Wright & Sanders; day's work....Grove, nr Filmore, alterations; cost $3,000; o, H. Froomberg: a, T. A. Eisen; c, W. Wisecarver....Post, x Kearny and Dupont, alter. to Morton House; cost $16,000; o, E. Barron; a, P. J. O'Connor; c, Mahoney Bros....Clay and Sansome, add'ns to Niantic Blk; cost $8,000: o, Capt. Thompson; a, W. Patton; c, J. W. Wessinger.

San Jose, Cal.—Market st, br bldg; o, G. Peirano; a, Theo. Lenzen; c, J. Sbarboro....Nr Astoria, a sash factory is being built by Hansen Bros....A large hotel is being built at the new town of Ontario, by the Chaffey Bros.; c, A. W. Boggs....At San Diego a large fr bldg, br basement is being built; o, J. P. Christensen.. Healdsburg, fr blog for the Seventh Day Adventists; a, H. T. Bestor; cost $12,000; day's work.

Alteration.—At Bakerfield, add'ns to hotel; o, Mrs. E. Eitel.

St. Helena.—Fr dwell nr town; cost $5,000; o, Jas. Dowdle.

Oakland.—Point Station, add'ns to school house; cost $6,115; o, S. & J. Newsom; c, N. N. Hinckley.

Sacramento.—Fourth, x I and J; improvements; cost $4,000; o, J. McGuire.

Ogdensburg, N. Y.—Cornwall Ont, br school house, cost $17,000; a, J. P. Johnston.

Cincinnati, O.—Ohio av near Clifton and 3d av, br. cost 8,000; o, B. Klemmeror; b, Kennie & Rosenstiel. ...Richmond near Linn, four flats, cost $20,000; o, S. Kuhn; b, Pat. Murry.

Bridgeport, Ct.—Colorado st, 12 fr. cottages, total cost $18,000; o, A. C. Bussick; a. Henry Lambert; b, Bennett and Edie... Main st, Banking building, cost $75,000; o, Bridgeport Nat. Bank; a, Lambert & Bunnel.

Reading, Pa.—5th st, church improvements, cost $22,000; o, Presbyterian Cong.

Washington, D. C.—Cor Rhode Island and Connecticut avs, 3 story and basement, cost $25,000; o, D. R. McKee; a, Gray and Sage.

Detroit, Mich. Griswold st, repairs to telegraph block lately burned, cost $13,000; o, Buhl; a, Julius Hess.

Denver, Col.—South 15th st, br dwel, cost $9,000; o, A. A. Shaw; a, E. P. Varian....15 Larimer st, br dwel, cost $10,000; o, J. A. Cooper; a, J. H. Littlefield. Site selected for government Post Office.

Philadelphia, Pa.—1326-28-30 Ward st, br dwells; b, Daniel Carlin ....Alder and Grand avs, br dwell; N. S. Bowers... alter 920, 922 Chestnut st, fr and int alter; b, Jas. H. Errickson....1114 Market st, fr and int alter, 1-st back build; b, Jas. H. Errickson ....818 Arch st, rear and int alter; b, W. N. Jacquett.

Wheeling, W. Va.—Nothing at $5,000 reported this week.

Boston, Mass.— Unnamed st near Quincy st, 1 fr manufactury; o, Ada C Rice; b, Thos. Rice....Milton av cor Evans st, 2 fr dwel; o, H. N. Haskell: b, Stinson & Cleaveland.... Terrace av, 1 fr dwel; o, Judah Bacon; b, John C. Bassett....1 Harvard st near Water st, fr dwel; o, Samuel P. Faulkner; b, Samuel P. Faulkner .... 507-509 Medford st, 1 fr storage shed; o, Page & Littlefield; b, Page & Littlefield....315-321 Chelsea st, 1 fr currying shop; o, A. B. Porter; b, A. B. Porter....Halleck st, 1 fr wagon house; o, Geo. F. Burkhart; b, Geo. F. Burkhart ...Commercial st, 1 fr storage lum; o, McNeil Bros; b, McNeil Bros .... East 4th st, fr storage house; o, Jas E. Rowe; b, Henry Keyes....Rear of 360 Maverick st, 1 fr boat house; o, Belmont Boat Club; b, Wm. C. Chick....Terrace av, 1 fr stable; o, Jas. V. Chase; b, Jas. V. Chase....215 Commonwealth av, 1 br dwell; o, Jas. Lawrence; b David Comery & Co.

MISCELLANEOUS.

Norwich, Conn.—Water st, the Taylor b, Queen Anne style; o, Mrs. Oliver Tyler Roath.

Point Pleasant City, N. J.—Capt. O. L. Minton's new hotel, to accommodate 100 guests, will be finished and ready for occupancy about Feb. 15; also the hotel being erected on the ocean front, by Rev. F. F. Wilson to accommodate 125 guests is rapidly approching completion.

A bill introduced into the Tennessee Legislature the 23d ult., the governor is directed to appoint a commission of three to take charge of the erection of a new insane asylum in Eastern Tennessee. The commissioner shall select an architect to prepare the plans and $75,000 are appropriated to carry the bill into effect.

Newport, R. I.—On Conanicut st, a st cottage; cost $20,000; is being built for Mrs. Mary Wharton, designed by Chas. L. Bevins. The builder is J. D. Johnson who is also building six cottages for J. & Chas. Pinard, of N. Y., at cost of $25,000; C. L. Luce has planned a cottage for Job. Wharton to cost $50,000.....A villa of br st is being erected for Miss Catharine L. Wolfe, of N. Y., at a cost of $250,000, built by C. E. Clark, of Boston; a, Peabody & Stearns. Another Boston builder Lyman Wilcott has contracts for homes for W. F. W. Weld, of Boston and Col. Theo. M. Davis, of N. Y., at $50,000 each Jas. McNeill is building a villa for Mrs. Julia H. Eldridge, of Boston, to cost $50,000, designed by Dudley Newton of Newport. Nathan Barker builds cottage for Mrs. Mary L. Bruen at $18,000; Clarence C. Luce of Boston is architect for Dr. J. J. Mason's house to cost $30,000; b, N. Barker.

Rochester, N. Y.—Paul st, part of new block extending from Mortimer st; cost $7,000; o, Alderman Geo. W. Archer; a, H. & C. S. Ellis.

Chicago.—Dr. De Wolf and Commissioner Cregier will select plans and location for a morgue in this city, visiting other cities for that purpose....Architect Egan who some years ago planned the north side county buildings has been retained to set matters right there, as many complaints of offensive smells, etc., have been made. His recommendations will shortly be laid before the county board....Market and Monroe st, br mercantile house; o, J. V. Farwell & Co; of pressed br and br st, occupies a city square and said to be largest mercantile building in this country; 22 acres of floor room and 20,000,000 brick used. An Allis Corliss engine of 250 horse power is used for lighting by electricity, It can run 2,0 electric lights. An engine of 650 horse power generates steam to heat the building. The boiler fed by two duplex-Wellington feeders, are set in Butman furnaces formed to consume the smoke. The firm are said to do a business of $20,000,000.

Providence, R. I.—On Dorrance. Pine and Orange sts; o, Ed. S. Aldrich of firm of Whitford, Aldrich & Co., the firm to occupy it for wholesale grocery business; a, Robt. Manchester. The new structure to be of iron and granite, with fronts of Danvers and Trenton pressed brick; iron columns of unique designs; soapstone roof; copper gutters and conductors.

Florida.—Building at Orlanda has been rapid of late, at least one house per diem during past twenty months, 4 churches, a masonic hall, 2 new hotels opened since Jan. 1.

New York—The Board of Health have requested Mr. C. C. Haight, architect, to prepare plans for hospital building for contagious diseases, and additional hospital buildings on North Brothers Island. The Navarro department houses nr Central Park will accommodate 128 families; cost $5,000,000.

Brattleboro, Vt.—George A. Hines, architect. has been selected by the committee on competition designs for the new school house, the building of brick to cost $40,000 and seat 600.

Brookline, Mass.—O. F. Smith, of Boston, is the architect for the new alms house fr b.

Chattanooga, Tenn.—Br. b, cost $7,000; o, Temple & Shipp; a, J. E. Burdick; 3 st b; cost $10,000; o, Dedgen Bros; a, J. E. Burdick; also br dwel, cost $5,000; o, Dr. Baxter; a, J. E. Burdick.

Portland, O.—Four ten, cost $14,000; o, Henry Fleckenstein; a, J. Krumbein... br stores; cost $10,000; o, H. H. Northrup; a, J. Krumbein; c, Schaum & Davidson .. Residence and stable, total cost $50,000; o, R. Knapp; a, W. H. Williams....Plans for a three story build containing stores and theatre, are being prepared by W. H. Williams; cost $50,000.

Patents.

[*It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, and Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.*]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

265,357. BALL VALVE. ALEXANDER G. ALEXANDER, Detroit, Mich. Filed Jan. 28, 1882. (No model.) Issued Oct. 3, 1882.

Brief.—The valve stem being about equal diameter as the valve opening the water pressure behind the valve will not exert sufficient force to hold it to its seat.

Claim.—1. The combination, substantially as herein described, of the shell or casing provided with an inlet and an outlet orifice, and divided into two chambers by a vertical partition having a lateral valve opening, the horizontally movable valve stem constructed of a diameter substantially the same as that of the valve opening, and a ball or float connected with the outer portion of the valve stem, essentially as and for the purposes set forth.

2. The combination, substantially as herein described, of the shell or casing provided with an inlet and outlet orifice, and divided into two chambers by a vertical partition having a lateral valve opening, said inlet and outlet connecting with the two chambers, respectively, the horizontally movable valve stem carry an attached valve, and constructed of a diameter equal or substantially equal to that of the valve opening, a pivoted swing lever connected with the outer portion of the valve stem, and a ball or float sustained by the outer end of the lever, essentially as and for the purpose described.

3. The combination, substantially as herein described, of the shell or casing divided into two upright chambers by a vertical partition having a lateral valve opening provided with a raised rim, the inlet and outlet pipes communicating respectively with the said chambers, a stuffing box in said casing, a horizontally movable valve stem arranged in the stuffing box, and constructed of a diameter equal or substantially equal to the diameter of the lateral valve opening, and a ball or float connected with the valve stem by a swinging lever pivoted to the shell or casing, the whole being constructed and arranged to operate essentially as and for the purposes set forth.

265,372. TRAP FOR WASTE PIPES. NICHOLAS BARRY, Jr., Muscatine, Iowa. Filed March 27, 1882. (No model.) Issued Oct. 3, 1882.

Claim.—The new article of manufacture, consisting of the trap for waste pipes, formed entire, and having a deep vertical chamber at B, a downwardly flaring vent, A, an inflow passage, C, an outflow passage, D, and a screw-tapped collar, all constructed substantially in the manner and for the purposes described.

265,481. WASH STAND. NATHAN O. BOND, Fairfax Court House, Va., assignor of one-half to Theodore J. Mayer, E. Kurtz Johnson, Fred W. Pratt, James L. Barbour, and F. Tenney, all of Washington, D. C. Filed June 2, 1882. (No model.) Issued Oct. 3, 1882.

Claim.—1. The combination, in a wash stand of a suspended bowl and hinged lid and connections, whereby an excess of water in the bowl depresses the lid and insures the discharge of the water, substantially as set forth.

2. The combination of the case, the hinged lid, and a bowl supported by arms connected to and supported by other arms attached to said lid, substantially as set forth.

3. The combination of the bowl and lid and jointed arms *g h* and stops *l*, substantially as specified.

4. The combination of the bowl, the lid, arms connecting the two, a hinge forming part of said arms and arranged to connect the lid to the case, substantially as set forth.

5. The combination of the hinged and counterbalanced bowl and a cock, S, and connections, arranged as described, to close the cock as the bowl descends, substantially as set forth.

6. The combination of the bowl, pivoted to be swung down from a horizontal position, a counterbalance and auxiliary weight and devices, as described, whereby the weight is added to that of the bowl when the latter descends to additionally depress the same, as set forth.

7. The combination of the bowl, pivoted to swing downward from a horizontal position, and the lid F, connected thereto, and connections between them, whereby the weight of the lid is added to that of the bowl as the latter descends.

8. The combination, with the swinging bowl, of a trough, J, and receptacle D[1], said trough being arranged between the bowl and the receptacle and pivoted to swing downward and expose its interior, substantially as set forth.

9. The combination of the pivoted platform L, vessel D[1], and trough J, with a catch retaining the trough, and means whereby the descent of the platform releases the catch, as set forth.

265,549. TINNER'S TOOL. JAMES M. URIE, Boulder, Colo., assignor of one-third to Frederick S. Hall, same place. Filed Aug. 16, 1882. (No model.) Issued Oct. 3, 1882.

Claim.—The expanding device, consisting of the cross heads B and D, having the hinged arms, A A and E E, plates or bars F F, and screw C, constructed and combined to operate substantially in the manner and for the purpose shown and set forth.

265,573. DISCHARGE PIPE FOR HOSE. CORNELIUS CALLAHAN, Chelsea, Mass., assignor to the American Fire Hose Manufacturing Company, same place. Filed May 25, 1882. (No model.) Issued Oct. 10, 1882.

Claim.—1. A hose nozzle having the threaded ring C and hose coupling section G, with the annular valve seat D *a* between them, combined with the valve ring *b b*[2] seated by the pressure of water thereupon, substantially as shown and described.

2. The valve ring *b*, having the portion *b*[2] and an operating handle, combined with the superposed and surrounding annulus D *a*, in which the valve ring and portion *b*[2] are seated by the pressure of water, the ring C, coupling G, and ring E, substantially as and for the purpose set forth.

265,601. APPARATUS FOR STEAM HEATING. WILLIAM E. HAXTUN, Kewanee, Ill. Filed March 14, 1881. (No model.) Issued Oct. 10, 1882.

Claim.—1. The combination, with the radiators in the building, of the street steam-supplying main, the steam pipe connection between said main and the radiator, the pressure valve located at a point in said pipe connection between the main and the radiator, the trap C in a branch pipe between the main and the pressure valve, the pipe for returning the water of condensation back to the boiler house, and a pipe leading from the trap to the return water pipe, substantially as described.

2. The combination, with the radiator, of the steam-supply main S, pipe connection between the two, the pressure valve between the radiator and steam supply main and the pressure valve, the water trap I, connecting with the radiator, the water return pipe W, and pipe connection between the same and said traps, substantially as described.

3. The combination with the radiator, of the steam-supply main S, pipe connection between the two, the pressure valve between the radiator and steam-supply main, the trap connecting with a branch pipe between the steam-supply main and the pressure valve, the water trap I, connecting with the radiator, the water meter J, pipe K, and return pipe W, substantially as described.

265,709. WATER-CLOSET TANK OR CISTERN. SAMUEL F. SNIFFIN, N. Y., assignor to Henry C. Meyer & Co., same place. Filed June 19, 1882. Issued Oct. 10, 1882. (No model.)

Claim.—In combination with the float-lever of the inlet valve and the outlet-valve, a cam-like lifter device flexibly connected to the outlet-valve and adapted to act directly on said lever of the inlet-valve, the construction being such, as described, that said cam-like lifter will come into contact with and hold up the said lever before it begins to operate to effect the lifting of the outlet-valve, all as set forth.

265716. DRAIN-TILE. JAMES TAYLOR, New Lexington, Ohio. Filed Aug. 17, 1882. Issued Oct. 10, 1882. (No model.)

Claim.—A drain-pipe consisting of the pipe-sections A, having turned flanged edges throughout their length, in combination with the pipe-sections B, having the edges throughout their length provided with the interlocking flange *b*, as set forth.

265,786. HYDRAULIC MAIN. WILLIAM R. BEAL, New York, N. Y. Filed July 24, 1882. Issued Oct. 10, 1882. (No model.)

Claim—1. A hydraulic main provided with the dip-pipes D, and with two communicating chambers, *a b*, the chamber *a* receiving the dip-pipes D and the chamber *b* having a detatchable cover and fastening devices, and communicating with the chamber *a* opposite each dip-pipe through an opening at the bottom of the chamber *a* and below the water-level, as set forth.

2. The hydraulic main having a chamber, *a*, and dip-pipes, and a supplemental chamber, *b*, provided with a removable cover, in combination with a stand-pipe, any suitable connections communicating with the chamber *b*, and an inflow water Pipe, F, connecting with the chamber *a*, substantially as set forth.

265,315. ELECTRIC LAMP. JOHN H. GUEST, Brooklyn, N. Y. Filed Nov. 22, 1880. (No model.) Issued Oct. 3, 1882.

266,362. HEATING STOVE. EDGAR W. ANTHONY, Boston, Mass. Filed June 15, 1882. (No model.) Issued Oct. 3, 1882.

265,368. HEATING STOVE. EDGAR W. ANTHONY, Boston, Mass. Filed May 22, 1882. (No model.) Issued Oct. 3, 1882.

265,364. ELECTRICAL LOW WATER DETECTOR. EDWARD H. ASHCROFT, Lynn, Mass. Filed June 2, 1882. (No model.) Issued Oct. 3, 1882.

265,365. ELECTRICAL ALARM FOR STEAM BOILER CLEANERS. EDWARD H. ASHCROFT, Lynn, Mass. Filed June 3, 1882. (No model.) Issued Oct. 3, 1882.

265,407. GAS COOKING STOVE OR RANGE. WILLIAM W. GOODWIN, Philadelphia, Pa. Filed June 30, 1882. (No model.) Issued Oct. 3, 1882.

265,408. BURNER FOR GAS STOVES. WILLIAM W. GOODWIN, Philadelphia, Pa. Filed July 15, 1882. (No model.) Issued Oct. 3, 1882.

265,410. ELECTRIC INCANDESCENT LAMP. JOHN H. GUEST, Brooklyn, N. Y. Filed Dec. 6, 1881. (No model.) Issued Oct. 3, 1882.

265,475. ELECTRIC LAMP. SIDNEY WATERS, London, England. Filed May 3, 1882. (No model.) Issued Oct. 3, 1882.

265,522. PORTABLE MOLD FOR CISTERNS. JAMES LOGAN, Waterloo, N. Y. Filed July 15, 1882. (Model.) Issued Oct. 3, 1882.

265,586. VAPOR BURNER. RUDOLPH FALKENRATH, Decatur, Ill., assignor to the American Vapor Stove Manufacturing Company, same place. Filed Feb. 28, 1882. (No model.) Issued Oct. 10, 1882.

265,587. GAS CUT-OFF. JOHN FARTHING, Chicago, Ill. Filed Aug. 21, 1882. (No model.) Issued Oct. 10, 1882.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

For the week ending Jan. 20, in 36 U. S. cities, and for the week ending Jan. 12, in one, the whole containing an aggregate population of 7,551,621, there are reported 3,251 deaths, corresponding to an annual death rate of 22.4 per 1,000, precisely the same as the rate for the preceding week.

In the North Atlantic cities the rate was 21.6; in the Eastern cities, 24.3; in the Lake cities, 18.9; in the River cities, 20.2; and in the Southern, for the whites, 17.7, and for the colored, 34.0 per 1,000.

In San Francisco, for the week ending Jan. 12, the rate was 20.2 per 1,000.

This mortality rate is higher than that reported in English cities for the week ending Jan. 6, viz., 21.8; but it must be remembered that in these English cities, for the preceding week, the rate was 27.6.

The high mortality in the Southern colored population, *i. e.*, 34.00, is slightly exceeded by the rate in Irish cities for the week ending Jan. 6, viz., 34.6. Diseases of the lungs are now everywhere a prominent cause of death. Diphtheria gives an increased mortality, especially in the Eastern and River cities. It gives about the same rate of mortality in German cities as in this country.

Small-pox shows a decrease in the number of deaths reported, but there is good reason for thinking that in some cities the deaths from this cause are not all reported.

The Southern cities, with the exception of the District of Columbia, report no deaths from diphtheria, scarlet fever, measles, or malarial fever.

NEW YORK DEPARTMENT OF PUBLIC CHARITIES AND CORRECTIONS.—The report of Dr. McCann, who is the examining physician for the Board of Commissioners of Public Charities and Corrections, in New York City, shows that during the month of October, 1882, 1,479 persons applied for medical relief, of whom 1,457 were admitted to hospital. Of these 870 were male adults and 582 female adults, there being but five children. 233 were surgical cases, 140 were cases of alcoholism, and 236 diseases of the respiratory organs. 652 were sent to Bellevue Hospital, 345 to Charity Hospital, and 381 to Homœopathic Hospital.

Digitized by Google

NEW YORK.—Dr. E. J. Darken reports that for the week ending Jan. 13 the Demilt Dispensary received 437 new cases, of which 103 were of chronic diseases and 191 surgical cases. the remainder 143 being cases of acute disease. Among these were three cases of scarlet fever, four of whooping-cough, five of measles, 11 of malarial fevers and 60 of acute lung diseases.

ALLEGHENY, PA.—Dr. J. H. Wright reports the prevalence of typhoid fever, and the freedom of the city from other contagious or infectious diseases.

INDIANAPOLIS, IND.—Dr. E. S. Elder reports that the death from small-pox recorded in the table is the first case of the disease. There is but one other in the city.

LOUISVILLE, KY.—Dr. Montgomery reports 11 cases of small-pox as having occurred during the week, five of these were isolated at their homes and six removed to hospital. The death recorded in the table occurred in hospital. There remain 40 cases in hospital and five in the city.

PITTSBURGHH, PA.—Dr. Snively reports one new case of small-pox.

MILWAUKEE, WIS.—Dr. E. W. Diercks reports 18 new cases of scarlet fever and five of diphtheria.

BOSTON, MASS.—C. E. Davis, Jr., City Clerk, reports 27 cases of diphtheria, 36 of scarlet fever and six of typhoid fever.

CLEVELAND, OHIO.—Dr. G. A. Ashmun, Health Officer, transmits reports for the weeks ending January 6, 13 and 20. The last is embodied in the table given above.

During the first mentioned week there were 54 deaths of which one was caused by violence, two by cerebro spinal meningitis, eight by consumption, two by croup, five by diphtheria, two by pneumonia, one by congestion of lungs and one by puerperal fever.

During the second week there were 68 deaths, three of which were caused by violence, two by cerebro-spinal fever, seven by consumption, four by croup, seven by diphtheria, two by typhoid fever, seven by pneumonia. one by congestion of lungs, two by acute bronchitis and one by puerperal fever.

LYNCHBURG, VA.—Dr. Thos. L. Walker, President Board of Health, reports the city free from small-pox.

ATLANTA, GA.—Dr. Jas. B. Baird states that two of the fatal cases of small-pox recorded in the table occurred in the small-pox hospital.

DETROIT, MICH.—Dr. O. W. Wight reports 24 cases of scarlet fever and 37 of diphtheria as having occurred during the week.

NEW YORK CITY LUNATIC ASYLUM, BLACKWELL'S ISL.—Dr. Franklin reports for the week seven admissions, three discharges, 2 deaths and 1,316 remaining under treatment.

NEW YORK QUARANTINE.—During the week ending Jan. 12 there arrived 1,871 immigrants, 549 of whom required and received vaccination. Dr. Wm. M. Smith reports that the surgeons of the European passenger steamships have established an excellent record for efficiency in their examinations of emigrants and the results of vaccinations.

WILMINGTON, DEL.—Dr. E. B. Frazer reports (Jan. 20) the occurrence of 30 cases of small-pox, nine of which have proved fatal, since the beginning of the year.

MICHIGAN.—Dr. Baker's report for the week ending Jan. 13, based on the observations of 60 medical men, shows the following diseases to have prevailed: rheumatism, bronchitis, neuralgia, tonsilitis, consumption, intermittents and pneumonia. Diphtheria was reported at 21 places in the State, scarlet fever at 17 places, measles at 14 places and small-pox at one place—Detroit.

HUDSON CO., N. J.—C. J. Rooney, City Clerk, in his report for December, an abstract of which will be given hereafter, states that the county death rate, 25.7, was 3.7 above the average rate for the six preceding Decembers, but was 3.7 below the rate for December, 1881. Jersey City's rate rose 5.4 above its average and was 2.6 above the county rate for December, 1882. Increased mortality from lung diseases was the chief cause of the higher rates. Small-pox was notable by its absence from reports, although at this time last year, 62 deaths from this cause were reported.

SYRACUSE, N. Y.—Registrar L. C. Dorwin, transmits a copy of his annual statement of vital statistics, for the year ending December 31, 1882. Total number of deaths 970. November furnished the smallest number 60, and January the largest, 107. Of the decedents, 288 were under five years and 199 over sixty years. Violence caused 54 deaths, cebro-spinal meningitis 6, consumption 186, croup 35, diarrheal diseases 69, diphtheria 11, erysipelas 4, typhoid fever 31, malarial fevers 25, scarlet fever 3, pneumonia 68, bronchitis 21, measles 1, puerperal fever 1, small-pox none, and whooping cough 9.

PROVIDENCE, R.I.—Dr. E. M. Snow reports that the increase in the deaths from typhoid fever this week, does not indicate any increase of the disease in the city. The decedents had all been sick several weeks. At the present time there are scarcely any new cases reported.

The annual report for 1882 from Providence, shows 2,242 deaths; males 1,080, females 1,162; white 2,147, colored 95; under five years 679, over 60 years 467. Causes: Accidents 76, cerebro-spinal meningitis 15, consumption 354, croup 32, diarrheal diseases 197, diphtheria 48, erysipelas 14, typhoid fever 141, malarial 3, scarlet fever 18, pneumonia 170, congestion of lungs 6, bronchitis 61, measles 4, and whooping cough 40. November gave the largest number of deaths, 247, June and October the smallest, 165 each. The last death in the city from small-pox, occurred in July, 1875.

ONTARIO, CANADA.—The Health Bulletin of the Provincial Board for the week ending Jan. 13 shows bronchitis to have been largely prevalent. Influenza, neuralgia, tonsilitis, anæmia and rheumatism follow bronchitis in order of frequency. Zymotic diseases are on the increase. "Small-pox outbreaks have again made their appearance. Forewarned is forearmed; *let the people attend to vaccination.*"

BERMUDA, WEST INDIES.—Consul Chas. M. Allen sends under date of Jan. 16 a copy of a communication from the mayor of St. George's to the *Royal Gazette*, proving by transmitted documents of an official character, that the town is free from contagious and infectious diseases. "I may add," says the mayor, "that the sanitary condition of the town has had the unceasing attention of the local board of health, particularly since the spring of 1882, and I may venture to assert, without fear of contradiction, that no part of Bermuda has been or is at this moment in a more healthy condition than this town."

HAVANA, CUBA.—Dr. D. M. Burgess reports for the month of December 535 deaths. Yellow fever caused 24, typhoid fever five, malarial fevers 17, diptheria one and croup three. Of the decedents by yellow fever eight were civilians and 16 belong to the military forces.

During the week ending Jan. 12, there were four deaths from yellow fever.

SANTIAGO DE CUBA.—Consul John C. Landreau reports 41 cases of yellow fever and 29 deaths from that disease during the month of December. The harbor and its vicinity is free from the infection.

RIO DE JANEIRO.—Deputy Consul General Jas. H. Murray sends reports for the weeks ending Dec. 16 and 23. Small-pox appears to be decreasing slightly. During the former week it caused 33 deaths, during the latter 28 deaths. Excluding small-pox from consideration the city may be regarded in good sanitary condition.

MARANHAM, BRAZIL.—Consular Agent J. J. Tavares sends reports for the three weeks ending Dec. 16, 23 and 30, showing the occurrence of 23, 19 and 27 deaths from small-pox.

GUAYMAS, MEXICO.—Consul Alex Willard, under date of Dec. 31, reports that the city is free from small-pox although this disease is understood to be prevailing in Maratlan and other ports along the coast.

ENGLAND.—The return of the registrar-general for the week ending Jan. 6, gives the average mortality rate in the 28 principal towns as 21.8 per 1000, that of Halifax 15.2 being the smallest, and Liverpool 30.9, the largest.

In London the births were 3.044 or 59 more than the average in the corresponding weeks of the last ten years, and the deaths 1,556 or 306 below the average. The deaths included five from small-pox, 50 from measles, 37 from scarlet fever, 21 from diphtheria, 31 from whooping cough, one from typhus and 21 from typhoid fever, and 15 from diarrhœa and dysentery. Seventeen new cases of small-pox were admitted into the hospitals, making 80 cases under treatment. The mortality rate in London was 20.5 per 1000.

IRELAND.—A summary of the returns transmitted by Consul A. B. Wood of Belfast is given in our table.

PARIS, FRANCE.—There were 1,169 births and 1,116 deaths during the week ending Dec. 27. Of the decedents 265 were under five years, and 275 over 60 years. Typhoid fever caused 66 deaths, small-pox 11, measles 16, scarlet fever one, whooping cough seven, croup and diphtheria 35, dysentery two, erysipelas six, consumption 199, pneumonia 87, acute bronchitis 44 and violence 27. Annual rate 25.9 per 1000.

During the week ending Jan. 4, there were 1,099 deaths, giving an annual rate of 25.50. Of these 303 were under five years and 266 over 60 years; males 576, females 523. Typhoid fever caused 71 deaths, small-pox 11, measles nine, scarlet fever one, whooping cough seven, diphtheria and croup 40, dysentery one, erysipelas ten, puerperal fever six, acute bronchitis 51, pneumonia 79, consumption 165 and violence 32. There were 84 cases of small-pox under treatment during the week, 940 of typhoid fever and 58 of diphtheria. The births during the week numbered 1,155.

During the last 13 weeks of 1882, there were 15,290 births in Paris and 14,178 deaths, as compared with 14,939 births and 13,098 deaths in the corresponding period of 1881. This large increase in the number of deaths is the result of the typhoid fever epidemic of which Paris has been the victim, as may be seen from the following figures:

	Typhoid.	*Small-pox.*	*Measles.*	*Scarlet Fever.*	*Diphtheria.*
4th quarter 1881.	433	119	152	48	619
4th quarter 1882.	1571	101	136	16	419
Increase in '82.	1138	...	...	...	...
Decrease in '82.	...	18	16	32	200

BRUSSELS, BELGIUM.—During the week ending Dec. 30 the death rate was 23.6 there having occurred 184 deaths in a population of 407,034 in the city and faubourgs. Of the decedents 66 were under five years of age. Small-pox caused six deaths, measles, scarlet fever, whooping cough and diphtheria one each, croup three, typhoid fever three, diarrhœa and dysentery 15, bronchitis and pneumonia 28, and consumption 19 deaths. The births during the week numbered 283, equal to an annual rate of 36.1.

VIENNA, AUSTRIA.—Consul General Jas. R. Weaver reports 352 deaths during the week ending Dec. 30, equivalent to an annual rate of 24.7. Small-pox caused two deaths, scarlet fever four, diphtheria two, whooping cough six, typhoid fever three, acute lung diseases 53, and consumption 84 deaths.

The report for the previous week (ending Dec. 23) gives 356 deaths. Small-pox three, scarlet fever three, diphtheria five, whooping cough four, typhoid fever three, diarrhœal diseases 15, acute lung diseases 50 and consumption 94. Death rate 25.0. Living births 450 or 33.2 per thousand of population.

ROTTERDAM, NETHERLANDS.—Consul Jno. F. Winter reports the prevalence of measles. During the week ending Dec. 30 eight cases of small-pox occurred one of which ended fatally.

STOCKHOLM, SWEDEN.—Consul Elfwing's report for the week ending Dec. 23, shows the occurrence of 107 deaths, males 45, females 62. Measles caused three deaths, scarlet fever five, typhoid fever two, whooping cough two, diphtheria four, croup four, bronchitis eight, pneumonia 16, consumption 16, diarrhœa six, and violence one death. Of the decedents 38 were under five years of age and 20 were over 60 years.

BARCELONA, SPAIN.—Consul Fred H. Schenck reports 272 deaths during the week ending Dec. 17. The death rate 44.17 is the highest which has obtained during the year. The increased mortality is attributed to atmospheric changes.

ST. PETERSBURGH, RUSSIA.—Consul General Stanton reports 700 deaths during the week ending Dec. 23; 335 occurred in persons under five years and 82 in persons over 60 years; males 381, females 322. Small-pox caused 28 deaths, fevers 29, and other contagious and infectious diseases 94 deaths. There were 71 patients in the small-pox hospitals, 906 in the fever hospitals and 1,203 in the venereal wards.

CALCUTTA, INDIA.—Consul General Mattson reports 344 deaths for the week ending Dec. 9, which is equal to an annual rate of 41. per 1,000. Cholera caused 89 deaths; this disease is confined mainly to the northern section of the town. The number of deaths from fevers amounted to 100; from bowel complaints 34, from tetanus 23, from consumption nine, from acute lung diseases 14, and from accident one.

MADRAS, INDIA.—The return of births and deaths in the municipality for the week ending Dec. 15, transmitted by Consular Agent L. Strange, shows a birth-rate of 45.3 and a death-rate of 42.4. The births numbered 346, males 174, females 172; the deaths 324, males 166, females 158. Small-pox caused two deaths, measles five, fevers 77, dysentery 26, and diarrhœa 13. No deaths from cholera are recorded.

MANILA, PHILIPPINE ISLANDS.—Acting Consul Chas. Klinck reports that by royal decree published in the *Official Gazette* Dec. 23 the port of Manila was declared free from epidemic cholera. All vessels arriving from the other ports of the island where the epidemic continues are subjected to a rigid quarantine of ten days.

SHANGHAI, CHINA.—Vice Consul General F. D. Cheshire reports a death from diphtheria during the week ending Dec. 19, and states that an outbreak of small-pox has occurred among the Chinese in the American settlement of Hong Kew—a number of children having died during the week. The disease has spread to the foreigners from their native servants and the laundries.

NAGASAKI, JAPAN.—Consul A. C. Jones sends copies of reports of the health of the province for the five weeks ending Dec. 2. During this period 64 new cases of cholera occurred and 40 deaths from the disease. The disease has been decreasing and the last report indicates that no cases remain under treatment.

ANNUAL MORTALITY RETURNS.

NEW HAVEN, CONN., *Jan.* 20 1883.

To Editor of THE SANITARY ENGINEER:

Can you tell me where I can find a published statement of the annual death-rate of the cities, of which you give us the weekly mortality?

The annual death-rate would afford some idea of the comparative salubrity of the different places.

The deaths in any given seven days is of little value for such a purpose.

Please publish the annual death-rate. It will be very highly appreciated by many of your readers, and greatly oblige,

Yours very truly,
C. A. LINDSLEY.

The annual death-rates of cities of the United States are not published anywhere in collective form. THE SANITARY ENGINEER is publishing weekly and monthly reports and ultimately hopes to be able to publish quarterly and annual reports. The weekly reports published are of value as warnings rather than for statistical purposes, but as they accumulate and are consolidated they will also be of statistical value. The great difficulty is to obtain reliable data. From New Haven it gets nothing.

BROOKLYN MORTALITY STATISTICS.

BROOKLYN, N. Y., *Jan.* 17, 1883.

To the Editor of THE SANITARY ENGINEER:

The actual mortality of the year 1882, in Brooklyn was 15,014 deaths by all causes. The estimated population of that year was 604,356. From these data we learn that the death rate in 1882 was 24.84 per 1,000 persons living.

Respectively, R. M. WYCOFF, *Sec'ty.*

For the work of his department next year, Commissioner of Health DeWolf, of Chicago, asks the Council for $121,527.50; the largest items being $18,000 for 20 sanitary police, and $6,500 for six tenement house and factory inspectors.

The bill introduced into the Pennsylvania Senate by Senator Adams to establish a State Board of Health provides for the appointment by the Governor of a board of six persons, a majority of whom must be physicians and one a civil engineer.

One result of the Milwaukee holocaust has been the discovering in Chicago, upon investigation by the Health Department, of 41 high buildings without fire escapes.

ALFRED BRADY.

Alfred Brady, the well known iron founder and manufacturer of plumbers' castings, died at the Rossmore Hotel in the city, on the 22d inst. He had received a stroke of paralysis two days before from which he did not recover consciousness.

The deceased was born at Sing Sing, New York, in 1817, but removed quite early with his parents to this city, where he began his business life by learning the machinist's trade. The business which Mr. Brady had conducted alone for the past fifteen years, and which, it is said, had grown to be the largest of its kind in the country, was established about the year 1860, when he, in partnership with his brother, under the firm name of A. & G. W. Brady, opened an iron foundry at Nos. 37 to 43 Greene street, where the down-town salesrooms remained until last November.

Two years later the firm was changed to A. & E. Brady by another brother taking the place of the first. The latter style continued till 1868 when the deceased assumed the whole business under his own name and established foundries near the foot of West 55th st.

Mr. Brady received a very slight stroke of paralysis about a year ago from which he never fully recovered, though he continued to attend to business and even the day before the final stroke was in his Spring street office saying that he felt unusually well and vigorous.

He leaves a widow and one daughter. The funeral was held in Dr. Wilson's church (57th street, near Broadway), on the 25th, and the remains interred in Woodlawn Cemetery.

Mr. William D. Gardner has been chosen President of the reorganized Gas Trustees of Philadelphia.

Dr. J. Burdon Sanderson has been made Waynflete Professor of Physiology in the University of Oxford.

A real Russian nobleman drives a small-pox wagon in Chicago.

Professor A. H. Brewer, of the Sheffield Scientific School, has been re-appointed a member of the New Haven, Ct., Board of Health for three years.

In speaking (in our issue of Jan. 18) of Dr. Paton's transfer to the position of food inspector, from that of smoke inspector, we inadvertently located him at Cincinnati instead of at Chicago, his real position.

Now that Philadelphia's drinking water has a bad taste, enterprising druggists are mixing it with alcohol and bottling it to sell next spring as pure vegetable bitters.—*Chronicle Herald.*

A severe drought is visiting the northern part of New York State. At Plattsburgh the reservoir was drawn so low recently as to create fear of disaster in case of fire, and farmers in the region are obliged to go long distances for water for the cattle.

The Hartford City Council have passed a resolution bidding the Chief Engineer of the Fire Department and the Fire Marshal to make a thorough examination of school-houses, factories, hotels, tenement houses and churches, with respect for their facilties for escape in case of fire.

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

The publisher of THE SANITARY ENGINEER will esteem it a favor if names of persons likely to be interested in the journal are sent to him, in order that he may send them specimen copies.

Pure Sugar vs. Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

HAVEMEYERS & ELDER.

DECASTRO & DONNER REFINING CO.

117 WALL STREET,

NEW YORK.

Reliable Food Products.

Great progress has been made, within a few years, in manufacturing food products, and the standard of quality has been raised to a point far beyond that which formerly obtained. We claim that this has, to a considerable extent, been due to our efforts. As the Largest Manufacturers and Dealers in the world in this line, we consider it to our interest to manufacture only PURE and WHOLESOME goods, and pack them in a tidy and attractive manner. *All goods bearing our name are guaranteed to be of superior quality, and dealers are authorized to refund the purchase price in any case where consumers have cause for dissatisfaction.* It is, therefore, to the interest of both dealers and consumers to use THURBERS' BRANDS.

H. K. & F. B. THURBER & CO.,

Importers, Manufacturers, and Dealers in all varieties of Food Products; New York, London, and Bordeaux.

NOTICE.

Our Canned Goods are put up with a special quality of tin, and most of them, being hermetically sealed while fresh at the sources of supply, preserve the fresh, natural flavors, and are REALLY FRESHER, MORE WHOLESOME AND PALATABLE than many so-called "fresh" articles which are exposed for sale during considerable periods of time in city markets.

H. K. & F. B. THURBER & CO.

West Broadway, Reade and Hudson Streets, New, York.
9 and 11 Fenchurch Avenue, London. E. C., England.
9 Rue Foy, Bordeaux, France.

Employment Wanted.

Under this head we will insert advertisements, not exceeding four lines, free of charge, for persons seeking employment. This privilege is restricted to persons employed by *Architects, Civil Engineers, Chemists, Electric Light Companies, Gas Companies, Plumbers and those engaged in the business of Heating by Hot Air, Hot Water and Steam.*

A FIRST-CLASS Plumber, recently employed on the work in Mr. W. H. Vanderbilt's house, wants steady work in the South. Address "J. L. D." Office Sanitary Engineer.

STEAM and Gas Fitters.—A good mechanic wants a steady job, can furnish good references. Address, G. H. D., office of SANITARY ENGINEER.

GAS and Steam and Plumbing Supplies.—A man well acquainted with the trade wants a position as traveler. Address, G——.

AN EXPERIENCED Traveler in the Plumbing Material Business would like situation. Best of reference can be furnished. Address, T. S., care SANITARY ENGINEER.

Proposals.

Office of THE WINFIELD WATER WORKS COMPANY, WINFIELD, KANSAS.

Proposals for constructing Water Works will be received by J. L. Horning, Sec'y. Proposals will be received for the Reservoir System.

All communication must be addressed to

J. L. HORNING, Sec'y.

Excavation on Frances Lane, Walnut Hills. Until Feb. 6. Address ANDERSON & HOVEY, *Civil Engineers*, 68 and 69 Johnston Building, Cincinnati, Ohio.

Dredging Saginaw River. Until Feb. 14. Address F. U. FARQUHAR, *Maj. Engrs. U.S.A.*, U.S. Engineer Office, Detroit, Mich.

Constructing an iron, truss or suspension bridge or covered wooden highway bridge over the Youghiogheny River. Until March 1. Address the McKEESPORT & YOUGHIOGHENY BRIDGE CO., McKeesport, Pa.

Constructing low truss wrought iron highway bridge over the Grand River. Until Feb. 10. Address A. C. SEKELL, *City Surveyor*, Grand Rapids, Mich.

Constructing Buffalo trunk sewer, length about 24,000 feet, diameter for principal part of the length, eight feet; estimated quantity of brick 20,000,000. Until Feb. 20. Address D. C. BEARD, *Chairman of Board of Sewer Commissioners*, City Hall, Buffalo, N. Y.

Erecting two brick buildings for asylum near Milledgeville, Ga. Until March 1. Address JOHN HAMMOND, *State Lunatic Asylum*, Milledgeville, Ga.

Improving Altamaha River, Ga. Until Feb. 7. Address JAS. C. POST, *Capt. U. S. Engineers*, Engineer Office, N. Y. City.

Labor and material for erecting marine hospital building at Memphis. Until Feb. 15. Address JAS. G. HILL, *Supervising Architect*. Treasury Department, Washington, D. C.

Furniture for barge office, N. Y. City. Until Feb. 3. Address CHAS J. FOLGER, *Sec. of Treas., U. S.*, Washington, D. C,

Erecting school house at Home City, O. Until Feb. 5. Address R. H. GIBSON, *Clerk of Board of Education*, Home City, Ohio.

Furnishing cut granite for custom house at New Orleans. Until Feb. 7. Address JOHN W. GLENN, *Superintendent*, U. S. Custom's Office, New Orleans.

Furnishing 25.000 pounds of half-inch iron chains. Until Feb. 16. Address MAJ. W. E. MERRILL, *U. S. Engineers*, U. S. Engineer Office, 82 west 3d street, Cincinnati, Ohio.

Post Office fittings at Bellville Ont. Until February 6. Address F. H. ENNIS, Department of Public Works, Ottawa.

Publications.

HEALTHY HOMES.

A hand book of House Sanitation for the use of all persons seeking a Healthy Home. A reprint of those portions of Mr. Bailey-Denton's Lectures on Sanitary Engineering, Chatham, which related to the "Dwelling." Enlarged and revised by his son, Eardley F. Bailey-Denton, C. E.; 206 pages and 140 engravings, 8vo, cloth, $3.50.

Bolton's Quantitative Analysis. The Students Guide in Quantitative Analysis, by H. Carrington Bolton, Ph.D., designed as an aid to Fresenius' larger work, with many original methods by the author, 8vo, cloth, $1 50.
"It is admirably calculated to encourage and stimulate the student in research." —*N. E. Journal of Education.*

Brush's Manual of Determinative Mineralogy. With an Introduction on Blow-Pipe Analysis, (constituting the Determinative Part of Dana's Mineralogy.) By Prof. Geo. J. Brush. 2d edition with corrections, 8vo, cloth, $3 00. Ditto. 3d edition, translated into the new system, 8vo, cloth, $3 50.

Craft's. A Short Course in Qualitative Chemical Analysis. With the new notation *revised with additions.* By Prof. Chas. A. Schaeffer of Cornell University. Third edition, 12mo, cloth, $1 50.

Dana's Text Book of Elementary Mechanics for the use of Colleges and Schools. By E. S. Dana, Assistant Professor of Natural Philosophy, Yale College. Second edition, 12 mo, cloth, $1 50.
"All Students and Mechanics will find the above a most admirable work."—*Industrial World.*

Dredge's. Electric Illumination. General Principles, Current, Generators, Conductors, Carbons and Lamps. By Conrad W. Cooke, M. F. O'Reilly, James Dredge, S. P. Thompson and H. Vivarez, chiefly compiled from Engineering, edited by James Dredge. With abstracts of the specifications deposited at the Patent Office between 1837 and 1872 having reference to Electric Lightning, prepared by Mr. W. Lloyd Wise. About 600 pages Text, nearly 800 illustrations. 4to, cloth, $7 50.

"American Sanitary Engineering."

BY EDWARD S. PHILBRICK, C. E.

Handsomely bound in Cloth, with numerous Illustrations.

PRICE, TWO DOLLARS.

"The Science and Art of Sanitary Plumbing."

BY S. STEVENS HELLYER.

A series of lectures delivered to working plumbers, under the auspices of the National Health Society of Great Britain.

Interesting to Plumbers and Architects.

Bound in Cloth. *PRICE TWO DOLLARS.*

FOR SALE BY

THE SANITARY ENGINEER,

P. O. Box 3037. 140 William St., New York

Copies will be sent, postage paid, on receipt of price.

THE SIXTH VOLUME OF

THE SANITARY ENGINEER.

The sixth volume of THE SANITARY ENGINEER includes the 27 issues from June 1 to Nov. 30.

The following are a few of the many articles of permanent interest:

Illustrated descriptions of the plumbing work in the well-known residences of Messrs. Wm. K. Vanderbilt, Cornelius Vanderbilt, Ex-Gov. Samuel J. Tilden, John Sloane. Also of the "Mills Building" (the largest office building in New York) and Minot, Hooper & Co.'s Commercial Buildings. A Russian Bath Establishment in Boston and the St. James Hotel in Baltimore.

"Berlin Sewerage." An elaborate report of the system just completed, with illustrations. By M. A. Durand-Claye, Engineer-in-Chief of Bridges and Roads of Paris.

"Trap Syphonage." Report with illustration of experiments for National Board of Health. By Edw. S. Philbrick and E. W. Bowditch. Also by Col. Geo. E. Waring, Jr. Also in England by S. S. Hellyer, Esq. Interesting and valuable data.

"Coverings for Steam Pipes." Results of Some Experiments. By Mr. M. J. Bird.

"The Health of Boys' Boarding Schools." By D. F. Lincoln, M.D.

Weekly "Mortality Returns" of the leading cities in the United States, with "Notes and Abstracts" from reports of Health Officers and correspondents of the National Board of Health. There have been printed each week beginning with issue of Oct. 12.

"Tin in Canned Fruits." By Prof. Albert B. Prescott.

"Negro Mortality of Memphis." By Dr. G. B. Thornton.

"Pullman Sewerage." Abstract of paper describing it. By Benezette Williams, C.E., Engineer in charge.

"Letters to a Young Architect on Heating and Ventilation." By Dr. J. S. Billings, Surgeon, U.S.A.

A model plan for an "Improved Tenement for Working Men in New York."

"Burning of Town Refuse at Leeds. A paper by Chas. Slagg, Assistant C.E.

"The Relative Uses of Gas and Electricity." By C. Wm. Siemens, F.R.S.

"Heat, House Plumbing and Mortality." By Lewis M. Leeds.

"The Management of Heating Apparatus." By Edw. S. Philbrick, C.E.

An extract from a paper by S. S. Hellyer on the "Unsealing of Traps by Momentum"—interesting in connection with experiments made by Messrs. Philbrick and Bowditch, and Col. Geo. E. Waring.

"Water Waste Prevention."

"Regulation of Exeter Water Works." A paper by Geo. I. Deacon, M. Inst. C.E., read before Society of Arts.

"Report of Boston Committee," and report of results in Cincinnati.

"The Massachusetts Law to Prevent the Adulteration of Food and Drugs."

"Notes on Prosecutions in Great Britain."

Practical articles on "Steam Fitting and Steam Heating," by "Thermus."

An illustrated article describing the "Accommodation for the Foreign Cattle Trade" at the port of Liverpool. By Francis Vacher, M.D.

Plan of "Flush Tank for Country Residences."

"Text of the Illuminating Oils Bill for New York State."

"The Effect of Water Level on Disease." By Baldwin Latham, M.Inst., C.E.

"A Form of Specification for Steam Fitting of an Eight Story Apartment House."

"Report on Oil Testers."

An article on the "Sewerage of Brighton, England." With reports by Sir Joseph Bazalgette and J. Bailey Denton.

A series of papers on "Water Analysis," from the *Analyst.*

"Lead Poisoning." By Dr. Edw. S. Wood, Harvard Medical College.

In addition to the foregoing, there are answers to a great variety of questions on the various topics treated by THE SANITARY ENGINEER, the usual record of patents granted and the weekly reviews of questions of current interest to sanitarians, and of the condition of the Gas and Electric Light Industries. This latter feature makes the paper of real value to inventors, since the aim is to state the facts without bias for either interest. Price, bound in cloth, $3. Postage 40 cents. P. O. Box 3037. THE SANITARY ENGINEER. No. 140 William St., New York.

Digitized by Google

A Valuable Book of Reference.

THE FIFTH VOLUME OF

THE SANITARY ENGINEER,

OF NEW YORK.

Includes the twenty-six weekly issues from December 1st, 1881, *to May 25th,* 1882.

A complete record of all United States Patents for fixtures and appliances used in plumbing, sewerage, gas fitting, gas manufacture, steam and hot water heating, ventilation, and electric lighting, makes it valuable to inventors and manufacturers.

The following are a few of the many articles of permanent interest:

A review of town sewering in England, with opinions on the question of small *versus* large sewers, or the combined *versus* the separate systems, by Robert Rawlinson, C.B, Chief Engineer, Inspector Local Government Board, England.

A report on the Sewerage of Concord, by Edw. S. Philbrick, C.E., instructive to town authorities generally.

Remarks by John S. Billings, Surgeon, U. S. Army, before the Academy of Medicine, New York, on sewer gas and the value of modern methods for excluding it from houses. This article throws considerable light on a question generally misunderstood.

Electric Lighting; its Fire Risks and their Remedies. Two articles by Prof. Henry Morton, President Stevens' Institute of Technology, Hoboken, New Jersey,

Illustrations, with description of the Arrangements for Heating and Ventilating the Bridgeport School House (intended to be a model building).

A continuation of Dr. J. S. Billings' Letters to a Young Architect on Ventilation and Heating, with illustrations of notable buildings.

A continuation of the "Sanitas" articles on Plumbing Practice (illustrated). Interesting to architects, builders, and plumbers.

Steam Fitting and Steam Heating, by "Thermus," a series of practical articles (illustrated), of great value to steam fitters and architects.

Illustrated Descriptions of notable jobs of Plumbing Heating, and Ventilating in Private Residences in the United States, including those of Mr. W. H. Vanderbilt and Mr. R. H. Bishop, of New York.

A series of articles on Petroleum Legislation in the United States, by E. G. Love, Ph. D.

A Report to the Greenock Board of Police on the Ventilation of the Sewers of Thirty-three Towns in England, compiled from information received from City Engineers, by Alex. J. Turnbull, C.E. Valuable to engineers and health officers.

A series of carefully prepared editorials on the Water Supply of New York, discussing the various schemes proposed for increasing it; also the measures to prevent waste. Opinions of prominent English engineers on the practice in England, and suggestions for American adoption, in connection with a controversy over the rules of the New York authorities with regard to the manner of flushing water closets. The letters and articles on the question of Valve *versus* Direct Supply to Water Closets are of great interest to manufacturers, plumbers, health officials and water works engineers.

Reports on Adulteration of Food and Drugs in the State of New York, being full abstracts of the reports of Professor Chas. F. Chandler, on Milk (fresh and condensed); Prof. G. C. Cornwell, on Butter (dairy and artificial), Cheese, Lard, Olive Oil, and Fruit Essences; by Professor A. H. Chester, on Canned Meats and Animal Foods; by Dr. E. G. Love, Ph.D., Cereals and the Products and Accessories of Flour, Special Artificial Foods for Infants and Idvalids, Baking Powders, Cream Tartars, Alum Powders and the "Alum Question;" by Professor A. S. Lattimore, on Canned Fruits and Vegetables, Vinegar Spices, etc.; W. H. Pitt, M.D., on Sugars, Glucose, etc.; J. E. Englehardt, Ph.D., on Wines, Beers, Spirits and Cordials; by J. Hoffman, Ph.D., on Crude Vegetable and Animal Drugs, Pharmaceutical Chemicals and their preparations; by Professor Caldwell, on Quinine Pills and Capsules; by W. G. Tucker, M.D., on Citrate of Magnesia and Seidlitz Powders.

These reports are on examinations made under the direction of the New York State Board of Health with a view of ascertaining the condition of the Food and Drug supply in the State, and the extent and charaeter of the adulterations practiced. They are valuable to health officials, analysts, and manufacturers.

Notes upon some Prosecutions in Great Britain under the Food and Drugs Act, by Alfred Senier, M.D, F.C.S.

Paris Street Cleaning, by James Tallmadge Van Rensselaer. An elaborate and full account of the system and the cost of its maintenance—of value to city authorities.

Washington Drainage, a carefully prepared review of the evils complained of, and the various schemes proposed for the reclamation of the Potomac Flats and the sewerage of the city.

Price, bound in cloth, $4.00. Postage 40 cents.

VENTILATION.

No. 68 LAKE STREET, CHICAGO.

A Book for Water Companies, and one that will give much information to persons intrusted with the charge of water works.

WATER;

Its Composition, Collection and Distribution.

BY JOSEPH PARRY, C. E.,

Engineer in charge of Liverpool Water Works.

SUBJECTS TREATED.

Composition of Water and Sources of Supply,
Purification of Water,
Modern Water Works in England,
Distribution of Water,
Water Rents, Rates and Charges,
Water Appliances for Domestic Supplies,
Waste of Water, Rural Supplies,
Water for Trade Purposes,
Regulations for the prevention of Waste and Misuse of Water.

Price $1.00. *Sent Postage Paid.*

Address,

THE SANITARY ENGINEER,

P. O. 3037. 140 William Street, N. Y.

READERS WILL CONFER A FAVOR BY MENTIONING THE SANITARY ENGINEER WHEN THEY COMMUNICATE WITH ADVERTISERS.

The business manager of THE SANITARY ENGINEER begs to announce that he has established a Book Department for the sale of books treating on subjects in which the readers of that journal have a special interest.

Orders for books are therefore solicited. Address,

BOOK DEPARTMENT,

THE SANITARY ENGINEER

140 William Street, N. Y.

P. O. BOX 3037.

The following books are sent post paid on receipt of price:

WEST, THOMAS D., AMERICAN FOUNDRY PRACTICE. Treating of Loam, Dry Sand and Green Sand Moulding, and containing a practical treatise upon the Management of Cupolas and the Melting of Iron. By Thomas D. West, practical Iron Moulder and Foundry Foreman. Fully illustrated..... .....12mo, cloth, $2 50

BOLTON, H. CARRINGTON, Ph.D. QUANTITATIVE ANALYSIS. The Students' Guide in Quantitative Analysis, designed as an aid to Fresenius' larger work, and many original methods by the author. 8vo., cloth, $1 50

"It is admirably calculated to encourage and stimulate the student in research."—*N. E. Journal of Education.*

FRESENIUS C. REMIGIUS. A MANUAL OF QUALITATIVE CHEMICAL ANALYSIS. By C. R. Fresenius. Translated into the New System and newly edited by Samuel W. Johnson, M.A., Prof. of Theoretical and Agricultural Chemistry, in the Sheffield Scientific School of Yale College, New Haven. 8vo, cloth, $3 50

FRESENIUS C. REMIGIUS. A SYSTEM OF INSTRUCTION IN QUANTITATIVE CHEMICAL ANALYSIS. From the last English and German editions. Edited by Prof. O. D. Allen, of the Sheffield Scientific School, of Yale College, with the coöperation of Prof. Samuel W. Johnson, of the same. This is an entirely new edition from new plates, the New Notation and Nomenclature being employed throughout. 900 pages. Second edition, revised and corrected. 8vo, cloth, $6 00

KIRKWOOD, J. P. COLLECTION OF REPORTS (CONDENSED) AND OPINIONS OF CHEMISTS IN REGARD TO THE USE OF LEAD PIPE FOR SERVICE PIPE in the Distribution of Water for the Supply of Cities. By James P. Kirkwood. 8vo, cloth, $1 50

LATHAM, BALDWIN, C.E. SANITARY ENGINEERING, GUIDE TO CONSTRUCTION OF Works of Sewerage and House Drainage, with Tables for facilitating the calculations of the engineer, with appendix, giving specifications for building a sewer in New York, together with a paper read before the Austrian Society of Architects, on building and planning sewers, translated expressly for this work... ....folio, ½ bound, $3 00

EKIN, CHAS. POTABLE WATER. How to form a judgment on the suitableness of Water for Drinking Purposes. Second edition. Phila., 1880....12mo, cl, 75

CALDWELL & BRENEMAN'S CHEMICAL PRACTICE. MANUAL OF INTRODUCTORY CHEMICAL PRACTICE, for the Use of Students in Colleges and Normal and High Schools. By Prof. Geo. C. Caldwell and A. A. Breneman, of Cornell University. Second edition, revised and corrected. 188 pages. Illustrated. New and enlarged edition.....8vo, cloth, $1 50

GERHARD, WILLIAM PAUL, C. E. DIAGRAM FOR SEWER CALCULATION. Constructed from Tables in Baldwin Latham's Sanitary Engineering and Calculated from Weisbach's Formulæ. This diagram is a compact graphic exhibit of the relation between the inclination, the diameter, the velocity and the discharge of sewers and house drains. It is especially useful in preparing estimates and preliminary plans of works of town sewerage or house drainage. The use of the diagram is explained by a number of different problems. As it renders unnecessary all tedious numerical calculations it is a valuable aid to hydraulic and sanitary engineers, architects, builders, contractors, health boards and sanitary officers..... 75
Diagram only, on heavy paper for office use..... 50

AUSTEN, PROF. P. T., INTRODUCTION TO ORGANIC CHEMISTRY. Translated from the German of A. Pinner, Prof. of Chemistry at Berlin, with additions and revisions by Prof. P. T. Austen, of Rutgers College. A Text-book for the use of colleges and high schools..... .....12mo, cloth, $2 50

BURR, PROF. W. H., C.E. A COURSE ON THE STRESSES IN BRIDGES AND ROOF TRUSSES, ARCHED RIBS, & SUSPENSION BRIDGES. Prepared for the Department of Civil Engineering at the Rensselaer Polytechnic Institute. Plates....8vo, cloth, $3 50

DU BOIS, A. J., HYDRAULICS AND HYDRAULIC MOTORS. With numerous practical examples for the calculation and construction of Water Wheels, including Breast, Undershot, Back-pitch, Overshot Wheels, etc., as well as a special discussion of the various forms of Turbines, translated from the fourth edition of Weisbach Mechanics, profusely illustrated. Second edition.....8vo, cloth, $5 00

BOYLE'S PATENT

Tidal Wave

WATER CLOSET.

Patented in all principal countries.

SECTIONAL VIEW.

A—Air Pipe. C—Supply Pipe.
B—Flush Pipe. D—Vent
E—Connection for Fresh Air Pipe.

A New Departure in Water Closets.

The closet is made of one piece of earthenware, and supplied with Waste-Preventing Cistern coming under the lowest rate of taxation, as adopted by the Department of Public Works of New York.

Wherever in use, the closet has given entire satisfaction, and is recommended by leading authorities on sanitary matters as coming up to the requirements of a first-class appliance of its kind, being

Simple and Positive in Operation, Clean in Use and Perfect in a Sanitary point of view.

Write for Descriptive Circulars

Further attention is called to

BOYLE'S PATENT

Universal Waste Preventing Cistern

AND

COMBINATION LEVER.

DISPENSING WITH SERVICE BOX.

The Cistern Valve insures both a copious preliminary and after-flush for either Hopper or Cistern Closet, the importance of which is well understood by every plumber. The flush can be regulated from one to four gallons.

Cisterns furnished, Cast Iron and Copper-lined.

We manufacture all the Carr Specialties in

WATER CLOSETS, HOPPER CLOSETS, SWINGING URINALS, BATH AND BASIN SUPPLIES, Etc., Etc.

and will send our descriptive catalogue to Architects and the Trade upon application.

HENRY HUBER & CO.,

85 BEEKMAN STREET.

H. A. ALLYN & CO., Managers.

"THE DU BOIS" TRAPS.

These Celebrated Traps are made in the same way as lead pipe—Sound and Smooth, Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

Chas. Butcher & Co.

MANUFACTURERS OF

PARQUET FLOORS

AND

The Boston Polish,

or Hard-Wax Finish.

Office, 171 Tremont St., BOSTON, MASS.

The Boston Polish is the only thing really adapted to Polishing Hard Wood Floors.

The Boston Polish is recommended by leading architects in Boston for both inside finish and floors.

RECENTLY PUT INTO THE WHITE HOUSE BY THE U. S. GOVERNMENT.

F. E. CUDELL'S

PATENT SEWER GAS AND BACKWATER TRAP

FOR

Wash Bowls, Sinks, Bath and Wash Tubs, Safe Wastes, &c.

204 Superior Street,

CLEVELAND, O.

This Trap is made of lead, except Dome Screw Cover and Ball, which are of hard metal.

The correct and disinterested conclusions from the tests lately made on Syphonage, for the National Board of Health proves this GRAVITY BALL **S** TRAP to be the only reliable safeguard against sewer gas.

Twenty-six thousand of them in use, giving full satisfaction to prominent Sanitary Engineers, Architects and Plumbers.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

B. P. BOWER & CO., Manufacturers, Cleveland, O.

Hemmoor Portland Cement Works.

This Cement is used principally by the German Government in the construction of Harbors, Docks, Piers, Fortifications, &c.

For prices, information, &c., apply to

BELLONI & CO., 41 SOUTH STREET, N. Y.

PUMPING ENGINE,

Send for Illustrated Circular and Price List of the

Rider Hot Air Pumping Engine

TO

CAMMEYER & SAYER,

93 Liberty Street, New York, and 20 W. Lake Street, Chicago, Ill.

Please mention this paper.

ERICSSON'S NEW PAT.

Caloric Pumping Engine

is especially intended for domestic use in lifting and forcing water from wells and cisterns, or from Croton pipes, to tanks on upper floors of buildings in city or country.

This pumping engine is entirely safe, no steam being employed, and is not liable to derangement.

All kinds of fuel will answer for this engine, but coal-gas is preferable, the consumption being only 15 cubic feet per hour. Besides, gas is handier and cleaner than coal or other combustibles. Servant girl can operate it.

Price for 6-inch cylinder, pumping 200 gallons per hour 50 feet: With gas furnace, $210. With coal furnace, $220

Price for 8-inch cylinder, pumping 350 gallons per hour 50 feet: With gas furnace, $260. With coal furnace, $275

Price for 12-inch cylinder, pumping 800-gallons per hour 50 feet; With coal furnace only.....$375

Price for duplex 12-inch cylinders, pumping 1,600 gallons per hour 50 feet; with coal furnace only.....$550

BARSTOW'S

Royal Garland AND Idlewild Square Base-Burners.

These stoves are made to meet the demand for Self-Feeding Base-Burners more in harmony with the prevailing tastes in house decoration. Of stoves representing their class, none have excited more favorable comment, and enjoyed a larger share of popularity, for the short time they have been before the public, than the ROYAL GARLAND and the IDLEWILD. They have many important features peculiar to themselves, that commend them over all others.

BARSTOW STOVE COMPANY,
230 Water Street, New York.

The "National" Patent Side Outlet Closet and Trap.

WITH IMPROVED FLUSH. (Registered).

Made either complete in one piece of Earthenware, or in two pieces with Basin and Trap separate.

An important alteration has been made in the *flushing* arrangement of this closet. The *supply* is now placed *opposite* the *outlet*, and a *new registered fan* attached which makes the closet more effective, and with less than two gallons of water it is guaranteed to perfectly flush out the soil and thoroughly wash the inside of basin.

The Most Cleanly, Durable, Effective and Cheapest Closet and Trap ever used, requires no fittings nor Machinery of any kind, and cannot get out of order.

For the perfect working of this closet a supply pipe not less than 1¼ inch must be used.

MANUFACTURED BY THOS. TWYFORD, HANLEY, STAFFORDSHIRE, ENG.

The "EUREKA" Wheel Pipe-Cutter.

☞ If the House of whom you purchase your supplies does not keep it, send direct to us.

The Body—is fitted with an adjustable Cast-Steel Jaw at the point where it comes in contact with the Pipe, which Jaw can be renewed at any time by simply removing one screw. By this system the wearing away of the Jaw (which is other cutters is the first part to give out) is effectually prevented, and this tool can be kept in first-class order at all times.

The Wheel Block—This is also of Cast-Steel, neatly fitted to its socket *and cannot be dropped out.* It is much more durable than the cast-iron blocks and is hardened at the point where the rod comes in contact with it.

The Handle—of this Cutter *is put on to stay*, and cannot be removed by the roughest usage, as it is a hollow iron handle, *cast fast to the Rod*, operating the block.

Manufactured by PANCOAST & MAULE, 243 and 245 South Third Street
PHILADELPHIA, PA.

Over 100,000 *now in use!*

JENKINS' PATENT

(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

INSIDE VIEW OF GATE VALVE.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

THE BRIGHTON.

There is a tendency in some quarters to demand a Hopper form of Water Closet and to dispense with what are called mechanical parts. This would be desirable, if the so-called mechanical parts did not secure advantages in the matter of a large body of water in the bowl, not otherwise obtainable, without resorting to methods not everywhere applicable or sufficiently demonstrated as practicable.

The Brighton Closet here illustrated is, we believe, the best compromise yet devised between the Hellyer form on the one hand and the Hopper on the other.

By examining the sectional cut, it will be seen that the bottom of the bowl is covered with water, while the flush and shape of the bowl is such that the trunk on the back is kept clean.

It is attractive in appearance, being all in one piece, of white earthenware.

The pipe *B*, connected with the trunk, can be run into a heated flue when desired.

These Closets have had a large sale in England during the past four years. We have had them in use in our factory nearly two years—and we now offer them to those who prefer a different form of Water Closet than the *Hellyer, which, by the way, does not, in a single instance, so far as we know, fail to satisfy those who have them in use.*

This will be known as

"Meyer, Sniffen & Co.'s Water Closet Apparatus No. 30."

Persons interested are invited to call at our warerooms, Nos. 46 and 48 Cliff Street, New York, or at No. 1 Pemberton Square, Boston, and examine this and other specialties that we have fitted up with water attached, including THE ROYAL PORCELAIN BATH, THE MODEL PORCELAIN SLOP HOPPER, THE HELLYER CLOSET AND HOPPER, THE RHOADS HOPPER, DOHERTY SELF-CLOSING COCKS, FULLER FAUCETS, etc.

MEYER, SNIFFEN & CO.

The sanitary advantages of the CRAGIE BIDET ATTACHMENT have long been recognized. It is intended to be fitted up in connection with a water closet, and saves the room required for an ordinary Bidet. It can be attached to any water closet now in use.

The undersigned have purchased of Mr. Cragie his patents and are prepared to furnish the Bidet Attachment so adjusted that they may be fitted up with any of the modern makes of water closets.

ADULTERATION OF FOOD AND DRUGS.

The New York law for the prevention of the adulteration of food and drugs imposes on the State Board of Health the duty of making the necessary investigations and inquiries to ascertain that the law is obeyed, and of preparing rules and regulations for the collection and examination of samples. It is also the duty of the Board to prepare and publish, from time to time, lists of the articles, mixtures and compounds, which, by virtue of the authority conferred upon it by the act, it declares to be exempt from its provisions; and it is to fix the limits of variability permissible in any article of food, or drug, or compound, the standard of which is not established by any National Pharmacopœia.

This law was approved June 2, 1881. For the next eighteen months the Board confined its work to investigations as to what forms of adulteration were actually prevalent, and the best means of detecting them. It published no lists of exemptions and fixed no standards of permissive variability; and it received from manufacturers but few requests for such exemptions or standards. Probably the manufacturers thought that the act was a piece of sentimental legislation which would never be enforced, and that it would be unwise to oppose it, since to do so would be to call attention to themselves, and add force to the prevailing opinion that it is time to put a stop to the cheating of the public in this way.

But about a month ago the Board proceeded to prosecute certain retail dealers for selling adulterated cream of tartar, mustard, coffee, etc., and the prospect is that this is merely a commencement.

Under these circumstances manufacturers who are engaged in the profitable business of mixing ground gypsum with tartaric acid, burnt peas with ground coffee, etc., have raised a considerable amount of money, employed able lawyers, and are proceeding to contest, by every possible technicality, appeals to higher courts, etc., the operation of the law.

All this was to be expected. They must either find some means of evading the law, or go to some other State to carry on their business. They complain more especially of three things: First, that they had not sufficient notice of the intention of the Board to prosecute. Second, that the Board has not published lists of exemptions or standards. Third, that so long as manufacturers in other States have no check in their work of adulteration, the New York manufacturers will find their market practically confined to their own State, as they cannot furnish pure articles at the prices for which the adulterated articles are offered; and if they label their mixtures so as to show their composition, as required by law, it will greatly injure their sale.

The man who mixes 95 parts of ground gypsum with five parts of tartaric acid knows very well that no exemptions or standards which the Board could make would cover his case, and as to not having had warning—the law itself is the warning.

Their third reason is the true one. If this law is enforced, as we hope and believe it will be, the exports of adulterated foods and drugs from New York will greatly diminish, and for a short time there will be a corresponding increase of this trade at Baltimore, Philadelphia and other cities. Is it not then very unwise to drive capital and trade to other States? To which we reply most emphatically, No—it is not unwise as regards that capital and that trade which is employed in cheating the people.

There is an abundant market for pure food and drugs, provided, only, that some reliable assurance can be given that they are pure. Let the State of New York give this assurance and her commerce will not suffer.

We do not think that any State should be permitted to send into other States adulterated food or drugs. If the State chooses to allow the cheating and poisoning of its own citizens to go on without hindrance, outside parties have no right to interfere.

In the meantime, we urge our State Board of Health to push their work, for they may be sure of the support of the community. They have already commenced the publication of lists of exemptions and standards, and this should be continued as rapidly as possible.

Those manufacturers who wish to furnish pure goods and to have mixtures so labelled as to show distinctly what they are, should keep the Board of Health fully supplied with information upon these subjects, and so hold up their hands in this good work.

Let honest manufacturers also insist upon such legislation by Congress under its constitutional authority to "regulate commerce between the States" as will practically confine the adulterations of food and drugs within the limits of that State whose narrow policy permits them.

Finally, we suggest that those manufacturers who are engaged in making mixtures request of the State Board of Health such exemptions and standards of variability as they (the manufacturers) deem expedient and proper, and we believe they will find the Board ready and willing to do everything that is reasonable and right.

THE CENTRAL SANITARY BUREAU OF ENGLAND.

The duties and powers of the Local Government Board of England are by no means generally understood in that country, and still less so here. Recently Sir Charles Dilke has been made the President of this Board in place of Mr. Dodson, and in an address to his constituents he has given a brief account of the duties of the office. It has to deal with all questions of local boards and towns improvement commissioners, and to approve all loans raised by local authorities under public health acts and local acts. It deals with proposals for making new sanitary districts and with the revision of by-laws of all local and sanitary authorities. It has to inquire into outbreaks of disease, and, if necessary, to put in force exceptional powers for the prevention of dangerous diseases, to advise on plans for hospitals, and to examine and report upon the reports of the medical officer of health for the city. The acts for the prevention of adulteration of food are carried out under its regulations. It has charge of the administration of the acts for prevention of the pollution of rivers and of the alkali acts, and of the registration of vital statistics. Besides all this, it has the poor laws to administer.

It is a board only in name—its president having much the same powers as, for example, our Secretary of the Interior.

For advice as to its sanitary recommendations it has a medical officer, Dr. Buchanan; an engineer, Mr. Rawlinson; and an architect, Mr. Smith; but the president has not heretofore placed any very heavy responsibility upon these officers, sometimes not consulting them, and sometimes disregarding their opinions. The great complaint made with regard to Mr. Dodson's administration is that its object seems to have been to do as little as possible. The *Lancet* remarks that "a fatal narcotism seems to fall on the brains of ministers who take office in this department." The *Medical Times and Gazette* says: "Mr. Dodson seemed to have regarded the post as one of rest, to have, therefore, determined on a policy of inaction. and to have carried out the same with remarkable pertinacity."

It certainly seems as if there were room for improvement in the organization and work of the sanitary branch of this bureau, and we believe that the medical officer would soon effect some important changes if allowed to do so by the president of the board. Let us hope that Sir Charles Dilke will not commence his work on the theory that he is personally omniscient and infallible and can decide engineering and sanitary questions without reference to the opinions of experts.

NEW YORK'S WATER SUPPLY.

No. III.

THE SUPPRESSION OF WASTE.

Glasgow is favored with what is now considered an abundant water supply, though this happy condition is due to the successful effort of Mr. Gale, the city engineer, to suppress waste. The practice is to require plumbing fittings to conform to a standard, set by the chief engineer, to have the plumbing of each house examined before water is turned on, and periodically thereafter.

Some years since, when Glasgow was threatened with a scarcity of water, increased powers and funds were allowed the chief engineer to secure the suppression of waste, and the results are stated at length in Stewart's paper on "Prevention of Waste of Water."

In certain localities, district meters were applied by way of experiment. These showed that it was possible to reduce an average consumption of 59.2 gallons (imperial) per head per twenty-four hours, to 26.6 gallons. The night rates which had been 45.0, were reduced to 10.8.

These gratifying results secured the extension of this system to forty-one sub-districts, and we quote the following, from the paper read by Thomas Stewart at the Institute of Civil Engineers:—

"A few of the more striking results are given here:

Number of District.	At Starting of Meters.		After the Three First Inspections.	
	Total.	Night rate per 24 hrs.	Total.	Night rate per 24 hrs.
	Gallons.	Gallons.	Gallons.	Gallons.
I.2	81.8	64.0	34.1	9.9
I.3	68.3	45.7	31.9	15.0
II.2	over 70.0	over 70.0	35.5	17.5
IV.2	41.6	27.4	27.4	8.3
IV.6	61.0	55.0	47.2	23.8

"In seventeen districts, at the starting of the meters, the consumption per head per twenty-four hours was 60 gallons or more; in eleven of these it was reduced by the first three inspections below 40 gallons. In twenty-five districts, at the starting of the meters, the night-rate per twenty-four hours exceeded 40 gallons; it was reduced below 20 gallons by the first three inspections.

"Appendix III. shows, that, at the starting of the meters, the average consumption, for all purposes, was 49 gallons per head per twenty-four hours, which was reduced to 32 gallons by the first three inspections; the corresponding night-rates were 37.7 and 17.5 gallons. The night-rates, however, are exaggerated, on account of the pressure being much higher at night than during the day. On the 6th of January, 1881, the consumption was 35.3 gallons, which shows a saving of 13.7 gallons per head, or, if the whole district under control be considered, the saving is 1,114,317 gallons per twenty-four hours, equal to 1.48 gallon per head of the whole population in the area of supply. If a saving of 13.7 gallons per head was made over the whole of Glasgow and district, containing 754,778 persons, the total saving would be 10,340,450 gallons per twenty-four hours.

"The operations showed, almost uniformly, that the quantity of water consumed increased during the nine weeks which elapsed between two inspections, and the most reliable observations gave an increase of 3.4 gallons per head, on an average. The total saving per head after the first three inspections were completed, was 17 gallons, so that if the consumption continued to increase at the rate of 3.4 gallons in nine weeks, the original rate of consumption would be reached in ten months and a half. In some of the districts the increase was at the rate of only 2 gallons in nine weeks; in others, it was at the rate of 7 gallons.

"An instance of the gradual increase in the rate of consumption may be referred to in sub-district IV. 3, when left without inspection for three months and a half. Before the night inspection, the consumption per head per twenty-four hours was 27.0 gallons, and the night-rate, 15.3 gallons. Fourteen days after the inspection had been made, the rates were 22.2 and 10.1 gallons; six weeks after the inspection the rates were 23.3 and 9.6 gallons; ten weeks after the inspection, the rates were 26.5 and 12.6 gallons; and fourteen weeks after, they had increased to 28.0 and 14.9 gallons."

It will be noticed that the application of district metres was not general in Glasgow, though the results obtained by their partial use no doubt secured for the chief engineer the authority and means to enforce a rigid house-to-house inspection, and to control the character of new fittings, though, as a matter of fact, more latitude is allowed in the trial of new taps and devices in Glasgow than in Manchester, Liverpool, and some other places. As may be supposed, manufacturers and inventors are constantly submitting new or alleged new devices for the approval of the engineer, claiming, as a matter of course, that they are superior to anything hitherto in use. Many are rejected on sight, others that hold out a prospect of success the engineer disposes of by consenting to allow them to be used in a certain house or row of houses if the builder requests it. A record is kept of such cases and their operation is watched for a year. As a general thing few articles survive this test, even of those that are subjected to it, and the authorities find it an easier way of disposing of sanguine inventors than to absolutely refuse to try their wares.

[To be Continued.]

We print on another page a letter from Mr. John Worthington, a member of a plumbers committee to prepare a plumbing ordnance. This letter is especially intended for the plumbers of Philadelphia, yet the sentiments expressed in it should be those entertained by plumbers everywhere. Popular ignorance in the past has fostered a want of appreciation of the plumber's calling, and has made it possible for men of no skill, little knowledge. and less principle to engage in this business. The public have encouraged them, and discouraged honest and capable competitors, because a low price was the only consideration that secured employment. Happily, a change has come in some quarters and is appearing in others. It can be hastened everywhere, if the suggestions conveyed in Mr. Worthington's letter are acted on in plumbers' associations and by plumbers as individuals. As associations, they must not admit, or retain as members, men known to do "skin" work, and when the prevailing sentiment in a plumbers' organization will secure the expulsion of men convicted of doing dangerous work, and swindling an employer, then, and not till then, will these organizations be able to exert the influence that such associations should possess in order to have a reason for an existence.

When the new Board of Health, of Paterson, N. J., entered on its work a few months ago, one of the local papers spoke of it as an indication that Paterson was going to be a well-governed city. At any rate the Board have done well in issuing, within a few days, a circular recommending a system of plumbing, which is substantially the same as that enforced in this city. We regret that we cannot find in the ordinance creating the Board, nor in the circular, that they have any powers in the matter beyond recommending, but, however that may be, they have certainly done a wise act in using the weight of their official position to induce their fellow citizens to adopt proper plumbing in their houses.

Senator Adams has introduced in the Legislature of the State of Pennsylvania a bill "to establish a State Board of Health for the better protection of life and health, and to prevent the spread of contagious and infectious diseases in this commonwealth."

It provides for the appointment of six persons, a majority of whom shall be physicians of good standing, graduates of regularly chartered and legally constituted medical colleges, and of not less than ten years experience in the practice of their profession, and one of whom shall be a civil engineer, who, together with a secretary to be chosen by these six appointees, shall constitute the State Board of Health and vital statistics of Pennsylvania. This Board is to have the general supervision of the State system of registration of vital statistics and of the registration of physicians, and is to recommend such legislation as it finds necessary in this connection. The salary of the secretary, who is the executive officer, and the only member of the Board who receives pay, is fixed at two thousand dollars.

This is too little to secure the kind of man that is wanted. If he can't, or won't do a good three thousand dollars' worth of work it is much cheaper to have some one who will. The bill is a very good one, and avoids the error of prescribing in detail work which is yet to be organized. It is time that the State of Pennsylvania provided such an organization and most assuredly the money needed to support it will be well and wisely spent.

LETTERS TO A YOUNG ARCHITECT
ON
VENTILATION AND HEATING.

BY JOHN S. BILLINGS, SURGEON, U.S.A.

No. XLIII.

In my last letter reference was made to small hospitals for contagious diseases as being usually simple and cheap. Within the last year, however, it has been suggested that more elaborate arrangements may be necessary in the case of those small-pox hospitals, which are to be located in large cities with comparatively thickly settled suburbs. In the report presented last year by the Royal Commission appointed to inquire respecting small-pox and fever hospitals, the conclusion is arrived at, expressed, however, with some doubt and hesitation, that small-pox hospitals may diffuse infection around them through the atmosphere, independent of any conveyance of the contagion by persons or things going from the hospital, or of the transportation of patients to it. This conclusion is based mainly on the investigation made by Mr. Power as to the diffusion of small-pox from Fulham Hospital, and as the result the Commission state that in the present state of our knowledge it is essential that in the construction and management of small-pox hospitals both atmospheric dissemination and personal communication should be, with the utmost care, guarded against. To prevent the atmospheric dissemination the Commission recommend that not more than 30 or 40 small-pox patients should be placed together in one locality, and that the separate small-pox buildings should be so constructed as to reduce within the smallest limits the chance of spreading infection. They say, "We fully believe that contrivances for this purpose might be devised, and we again call special attention to the evidence on this point which has been furnished to us by Dr. Burdon Sanderson."

Turning now to the evidence of Dr. Burdon Sanderson, who is one of the most distinguished scientific men in London, and whose advice in such a matter is entitled to the greatest respect, even if it were not endorsed as it is by the Commission; we find that he proposes to so construct the small-pox ward that all the air in it which has come in contact with the patients, can be subjected to a high temperature to destroy its dangerous properties. He says: "As the outlets of air are the sources of danger and not the inlets, it is preferable that the air should be drawn out of the hospital, and not driven into it, and, consequently, we should choose a mode of ventilation accordingly, and that being adopted, the beds for the patients should be placed as near the outlets for air as possible; and further, the outlets themselves should be as near together as possible. The communication between the outlets and the source of motion, whatever its nature might be, should be as direct and ample as possible. Considering all these purposes, it is desirable that each ward should be in the form of a ring, with the chamber from which the air is directly extracted in the centre of the ring, the annular being the simplest form that can be given to it; that is to say, the one that makes it possible to make the opening for extraction of air communicate more directly than any other with the space in which each bed is contained. Then for a ward of 12 beds, having a capacity of about 1,200 cubic feet per bed, the removal of air should be about 120,000 cubic feet per hour, and, consequently, the removal of air per patient 10,000 cubic feet per hour. * * *

"The beds would be arranged as near as possible to, and immediately below each extracting opening, and would be placed against the internal wall, and each bed would be placed between two of the septa or screens which pass to a certain distance out from the internal wall into the annular space, so that the head of each bed would be included in the space between each two neighboring septa. The space within the ring communicates with the annular space which

answers the purpose of the ward, by extracting openings, and also with an extractor, preferably a fan. An extracting shaft might, of course, be substituted for the fan; but I think a fan preferable on the ground that its action is more independent of temperature and wind, and therefore more constant, and that it is more economical. The fan would collect the air from the ward and at once discharge it into a chamber, where it could be subjected to a higher temperature, so as to destroy all organic matter it might contain."

The windows are not to open. Twenty-four openings for fresh air are to be made in the external wall, each having two square feet of area. The movement of air through the outlet openings is intended to be at the rate of one mile per hour, allowing 10,000 cubic feet of air for each patient, and to secure this slow movement and thus to prevent draughts, the outlet openings are also to be two feet square. The method of warming proposed is to carry around hot water pipes in front of the inlet openings. From the fan the air is to pass to a gas furnace, probably in the roof of the house.

From this description and the accompanying plans, of which copies are appended, it is evident that while it is theoretically possible to thus disinfect all the air passing through a small-pox ward, it would be at a relatively great expense. The circular ward is used in the new City Hospital at Antwerp, and the same principle is employed in the Octagon Ward of the Johns Hopkins Hospital, at Baltimore; but in both these the beds are arranged against the outer wall, having the heads towards the windows, which is a much more convenient way of arranging them than the plan proposed by Dr. Sanderson, both because it allows more space about each bed and because it does not put the patients facing the light, which would be extremely unpleasant in the acute stage of small-pox.

A second objection is that the central shaft is unnecessarily large, as are also the inlets into it. It is not desirable to reduce the velocity of the air at the outlets or in foul air ducts below four or five feet per second, because at very low velocities a very slight thing will disturb the currents. The velocity at the outlet has comparatively little to do with the production of draughts. There seems to be no necessity whatever for the use of an aspirating fan in the plan proposed. If the air is to be heated to a temperature of 250° F. and upwards, which is necessary to secure its disinfection, this heat will in itself furnish all the aspirating power required. The use of gas to produce the heat required for such large quantities of air would also be unnecessarily expensive; a coal furnace would do the same work at half the cost.

In the plan proposed, in cold weather, a large amount of the incoming fresh air, and the heat

Digitized by Google

employed in warming it, would be wasted, since it would rise rapidly from the point of entrance, taking almost a direct line to the point of exit, and passing above the beds, the occupants of which thus get no benefit from the main stream of fresh air, but must rely on what comes to them from a sort of eddy and from diffusion. It would have been much better to introduce the greater part of the air through a grating beneath and between the beds, in which case the patients could be kept bathed in a steadily ascending stream of air, moving at the rate of say four miles per second; and this would be effected with less than half the amount of air and expenditure of fuel required in the proposed plan. It should be remembered that in a hospital of this kind, where special arrangements are to be made to secure a steady, uninterrupted stream of air through the ward, the allowance of floor space and cubic air space per patient become of secondary importance, so far as ventilation is concerned, and may be fixed mainly by considerations of convenience of administration. This ward might be made ten feet less in diameter and the central shaft reduced to four feet in diameter, with good effect.

These suggestions are made, not for the purpose of fault-finding, but because everything which comes from such distinguished authority, should be made as perfect as possible.

It seems probable, however, that the neighborhood would be more certainly and economically protected by the continuous enforcement of vaccination, than it would be by any particular form of hospital.

[To be Continued.]

HYGIENE OF THE DWELLING.

Mr. James C. Bayles, editor of the *Iron Age*, lectured before the Newark City Council of Royal Arcanum, recently, on "Hygiene of the Dwelling." Safe and comfortable houses were, he thought, rare. There were those who had come to believe a house could not be provided with "modern conveniences" and be safe to live in; who thought the only safe houses were those built in the primitive style. He did not think so, however, but maintained that good plumbing and careful arrangements would make a building quite safe. He believed nearly every house should be provided with two vertical soil pipes, one at the rear and another about one-third from the front wall of the building back, or near the centre, in order that shorter connections might be made therewith, and the custom of piping long distances under floors to a rear soil pipe, avoided. It also afforded less opportunity for plumbers' errors and carpenters concealing them. Every connection with soil pipes should be independent and as short as possible, so that the emptying of one basin would not disturb the contents of any other. These vertical pipes should extend above the roof, and he favored no crown or cap—a simple open end. Every trap should be ventilated. He knew cunning devices might be constructed to avoid the necessity for ventilation, but they involved too much risk; perfect plumbing must be done, it must be a nice working contrivance, and all accidents must be avoided.

A source of much evil might be found in the nooks and corners and cubby-holes frequently left by the builder for convenience. These become the receptacles of old shoes, rolls of rags, etc., all of which were better in the ash barrel. The cellar is an important apartment. It must be kept clean and dry. The first sign of mould should be looked upon with alarm, and he preferred decaying animal matter to decaying vegetation. A bin of rotting potatoes was worse than a dead cat. It should have light and ventilation.

The heating of a dwelling has a great hygienic influence. He preferred the hot-air furnace. A large furnace, that would not have to be overworked, or two, of different sizes for different seasons, pumping air at a temperature of not more than 100° F., with rooms so venti ated that it could find egress as fast as it was forced in, would be about the thing, always provided the furnace was fed from a pure source. Letting in foul air from the cellar, or that obtained under porticos, or often on a ground level through channels never cleaned, were bad arragements. Air which in the first instance is fit for the lungs only should be used. Sound pipes and good joints will avoid coal gas and other troubles proceeding from the hot air furnace, and rooms thus warmed will never want for fresh air when it exercises a force of fifteen pounds to the square inch on every crevice, It cannot be kept out. For ventilation he liked the open fire-place.

PROTECTING PIPES FROM FREEZING.

So much damage was caused to plumbing in Edinburgh by the the freezing of pipes during the severe weather two years ago that the Sanitary Protective Association of that city bethought themselves to issue a pamphlet on how to protect pipe and fixtures from freezing. Some of their directions, of course, apply to English and Scotch plumbing rather than to ours, but most are equally good tor this country.

Their first recommendation is that good fires should be kept up, even in unused rooms, so as to warm the house thoroughly.

"In apartments where there is no fire place the gas may be kept burning, or a gas or paraffin stove may be used. It must be remembered that water piping often passes through rooms in which its presence is not suspected.

"Direct communication between the outer air and apartments or spaces containing piping, whether through windows or other ventilating openings, should be avoided by having such openings temporarily closed.

"Water should not, intentionally or through defective repair of the water fittings, be permitted to trickle at any water closet, sink, bath, or basin connected with an outside or exposed soil-pipe, since, apart from the enormous waste of water which this course involves, it is very likely to result in the freezing up of the soil pipe.

"Water which has to remain stationary for any length of time in the water closet, bath, sink or basin traps, may be rendered less likely to freeze by the addition of a quantity of salt. A handful of coarse salt may with advantage be thrown down a water closet each time it is used.

"Exposed portions of piping should be emptied of water during the night. To empty the main water supply pipe, which is that establishing communication between

the water company's pipe and the various cisterns in the house—(*a*) the stop-cock controlling the entrance of water into it should be shut; (*b*) the draw off tap placed upon the house side of that stop-cock should be opened and left open; and (*c*) a little water should be drawn out of each cistern in the house. To empty pipes which distribute water from the cisterns, it is necessary—(*a*) to prevent the water in the cisterns entering the pipe to be emptied; this is usually effected by means of a drop-valve let fall into the mouth of the pipe; (*b*) to admit air just under the valve, the usual means of securing this being an air-pipe taken from the under side of the drop valve, and carried above the cistern water level; and (*c*) to open the taps connected with the pipe.

"The kitchen fire should be drawn if water cannot be obtained at the hot water taps connected with a pressure boiler.

"Before the winter is fairly begun, all stop-cocks or valves controlling the water supply should be examined to ascertain that they are easily accessible, and that they are in working order."

With respect to the position of pipes and fixtures the following points should be attended to:

"When possible, pipes run in very exposed positions should be shifted.

"Pipes which cannot so be shifted should, as far as possible be protected from direct air currents, and should be jacketted with some porous material, such as saw-dust, hairfelt, or plaster of Paris, and kept thoroughly dry.

"Pipes run underground in this neighborhood (Edinburgh) should be placed at least two feet six inches beneath the surface.

"Chases containing piping should be built across at intervals, so as to prevent currents of cold air blowing up or down them.

"Safe tray waste pipes which are carried direct to the open air should be protected by hinged flap valves hung upon their mouths.

"Cistern overflow pipes which pass direct to the open air should be trapped by means of self-filling traps, as in the annexed sketch.

"A layer of roof felting may be placed between the sarking and the slates.

"The wallheads may be beamfilled, but only in the immediate vicinity of piping, or, where necessary, to protect it from direct air currents.

"Where rain-water has to be conveyed from a centre gutter to either front or back slopes of a roof, this should be done by means of a closed pipe, and not by means of an open gutter.

"Exposed positions under cisterns or in which piping is placed, and which lie close to a fire-place and chimney, may be heated by the circulation of hot water from a boiler heated by a Bunsen burner. The products of combustion should be passed up the chimney.

"Small hot-water coils connected with existing hot-water piping will often give sufficient heat to prevent a cistern becoming frozen.

"Cisterns should be placed in properly constructed spaces, from which it is possible to exclude cold currents of air.

"Various devices have been proposed by which it is supposed that pipes might be prevented from bursting even when the water inside them freezes. None of these inventions have so far been practically successful. Probably that based on the principle that a pipe with a circular section has a larger capacity than one with a flattened or oval section, is the most ingenious, and most likely to be successful.

"Leaden pipes outside the house may be thawed by lighting a fire of paper or shavings close to them, or by throwing hot water upon them. Leaden pipes inside the house may be thawed by laying cloths dipped in hot water upon them, but unless it is certain that the means of shutting the water out of the frozen pipe is in order, it is better to have competent assistence in thrawing the pipes.

"Water closet basins, iron waste pipes, etc., should not be thawed by throwing hot water over them, as they are very liable to crack."

THE CESSPOOL NUISANCE.

We store up the wastes in these horrid receptacles all about our premises, and even under our houses. There are premises in Trenton full of these glutted reservoirs of foulness, with no room for any more. Fancy the effects of living in the centre of such a cluster of accummulations of filth! The house connections with these cesspools are often without traps, and the deadly gas they generate pervades the home. They cannot fail to pour their reekings into the air through the earth and other outlets. They pollute the air we breathe. The New York State Board of Health has officially declared: "That the use of privy-vaults, privy pits, and cesspools, is seriously affecting the public health;" and further, "that all excreta should be removed from the neighborhood of human dwellings, instead, of being stored up near them in pits, vaults or pools, to poison the water, earth, and air." In some European cities the abandonment of the old cesspool system has already been accomplished, and in others the measure is being seriously contemplated. Dr. E. Vallin, Professor of Hygiene at Val de Grace, says that every one is agreed, at least in principle, upon one point, namely, that permanent cesspools, as forming a structural portion of dwelling-houses, should be superseded.—*Trenton State Gazette.*

In making the excavations for the new sewer at the Brooklyn Navy Yard the workmen are unearthing human bones and skulls near the Long Wharf. The wharf is built upon the beach where were buried those who died during the Revolution on board the English prison-ships that were anchored off the Wallabout. Six barrels of the bones of these Revolutionary ship-martyrs have been dug up since January 3, when the work began.—*Chicago*

Gas and Electricity.

Illuminating Power of Gas in New York City.

Week ending	New York Gas Light Company.	Manhattan Gas Light Company.	Metropolitan Gas Light Company.	Mutual Gas Light Company.	Municipal Gas Light Company.	Harlem Gas Light Company.
Feb. 3.....	24.47	18.53	21.15	27.47	29.29	19.35

E. G. LOVE, Ph.D., *Gas Examiner.*

DANGEROUS ILLUMINATING OILS.

The first indictment under the new law of this State (passed June 6, 1882, the full text of which may be found in THE SANITARY ENGINEER of June 15, Vol. VI, page 52), prohibiting the sale of illuminating oils which emit an inflammable vapor at a temperature below 100° F., was granted, on the 1st inst., by a grand jury at Utica, on complaint of State Board of Health Inspector Colby. The indictment is against Messrs. A. Ethridge & Co., wholesale dealers of Rome. The character of the oil sold by them became known to the Board through an accident which occurred at Herkimer, on the evening of Nov. 27, 1882, when Mrs. Peter J. Casler was fatally burned by the flames of oil which had been spilled on her clothing from a broken lamp, and her husband also severly burned in attempting to extinguish the flames. Inspector Colby at once made examination and found the vapor flashing point of the oil in the can from which the lamp had been filled was but 93° F. An independent examination of the oil sold by the retail grocers, Messrs. Parkes & Barry, of Herkimer, of whom the Casler family had purchased their oil, showed the same flashing point. The barrel from which it was taken was branded with the name of Ethridge and Co., of Rome, and also "N. Y. State Legal Test."

The Inspector also brought cases at the same court against three firms of retail grocers in Rome, of which he had purchased samples of oil on Oct. 13, 1882, viz.: Messrs. J. H. & J. Williams, Messrs. Brigge & Clark, and Messrs. T. J. O'Connell & Co. His examination showed the flashing points of these samples to be 81°, 81° and 79° F., respectively. Indictments were found in these cases also. Arrangements will be made for as early a trial as possible.

LONDON GAS SUPPLY.

A man who makes his own gas, writes to the London *Times*, complaining of the London gas supply. He says, the semi-transparent globes are coated within a few hours with a "brown residuum," and exclaims, "how destructive to health the gas must be, and how much sulphuretted hydrogen passes into the lungs of those obliged to breath it."

He considers that gas is free from impurity, if it does not discolor lead paper within ten seconds. This is the test which he applies to his own gas.

It would appear natural that a man who made his own gas, might be supposed to know a little something about the subject, but such is not always the case, it seems.

The Gas Referrees require that the London gas shall be entirely free from sulphuretted hydrogen, and, as a penalty is fixed for violation of this, and, as the gas is tested daily by the examiners, it does not appear probable that this substance would be found except at rare intervals.

Sulphuretted hydrogen is a combustible gas, and even though it were present, it would be converted in the burning of the gas, into sulphurous oxide, the same as other sulphur compounds. It is not the cause of the formation of the "brown residuum."

Moreover, sulphuretted hydrogen may exist in gas and its presence not be detected by a ten-seconds' exposure to lead paper. We know of a gas supply in which the "total sulphur" seldom exceeds ten grains in 100 cubic feet, and which, nevertheless, shows the presence of sulphuretted hydrogen almost constantly. This impurity, therefore, is not to be taken as indicating the purity of a gas supply, even with reference to the sulphur compounds.

The letter in question is headed "Gas *vs.* Electricity," and its writer, in closing, asks that his test be applied, and then let anyone "judge for himself whether gas or electricity is least injurious to health."

It is unfortunate that the press is so often used to give expression to erroneous and ridiculous notions, without a word of comment or criticism.

ELECTRIC LIGHT NOTES.

An electric light company, with a capital of $150,000, has been organized in Hoboken.

The Dublin Electric Light Company which was formed in June, 1881, with a capital of about $750,000, has been wound up, and its plant will be sold.

It has been decided to hold an International Electric Exhibition in Vienna, to be opened on the 1st of August next and to close on the 31st of October.

The electric engineer, appointed by the Sheffield, Eng., Corporation, has reported against adopting electricity for street lighting.

The Hartford, Ct., *Courant* says that the American Electric and Illuminating Company will be maintaining between 500 and 600 lights in Boston within 60 days.

The Thomson-Houston Electric Light Company are lighting a few business houses on Market street, Philadelphia, using underground wires. The conductors are made of heavy copper wires, encased in cotton saturated in wax and then covered by a close-fitting lead pipe.

"The Sperry Electric Light Motor and Car Brake Company" of Chicago has recently been organized, claiming to have a capital of $1,000,000, to push the inventions of Mr. Elmer A. Sperry in electric lighting and the application of electricity in motors.

The Committee on Ferries and Franchises of the Aldermen of this city, have presented to the Board a report on the petition of the New York Electric Lines Company for permission to lay electric wires under the streets. They recommend that the petition of the company should be granted, its operations, however, to be subject to the provisions of the ordinance regulating the laying of underground wires.

The new ordinance regulating the laying of underground conduits for electrical purposes which is now before Philadelphia Councils, provides that authority must be obtained by ordinance before any street shall be broken for the purpose of laying conduits, etc., and that no street shall be opened for a greater distanee than 500 feet at any one time, the width of such opening not exceeding 2 feet. The ordinance further provides that parties laying con duits shall be responsible for damages to gas and water mains, and sewers. The city is given the privilege of using or occupying three of the wires or conductors of any company for any municipal purpose free of cost, provided thirty days' notice is given. The ordinance provides the following charges: For overground electric lighting wires, an annual payment of $5 per mile; for overground telegraph or telephone wires, $2 50 per mile; for electric lighting wires laid under ground, $2 50 per mile, and for telegraph or telephone wires under ground, $1 per mile.

Meter-ites.

A bill introduced in the California Legislature makes it a crime for any hotel keeper to neglect to hang upon every gas fixture printed directions about turning off, and a warning not to blow out the gas.

A bill was introduced by a Mr. Curtis, in the Illinois Legislature, the 27th ult., to provide for the inspection of illuminating oils. It authorizes the Governor to appoint a State inspector of oils, and adopts the Michigan tester.

Bids received for lighting Columbus, O., made the cost, if the 1,000 lamps were lighted by gas and 462 by naphtha, $25,804. If all were lighted by naphtha, $22,621. The contract was awarded, for all the lamps, to the naphtha company.

Astoria, L. I., is supplied in part with naptha gas made by Magnus Gross' process, and furnished by the Excelsior Gas Light Company at $1 50 to $1 75 per 1,000 cubic feet. The gas is said to be 23 and 24 candle power. The present consumption is about 20,000 cubic feet daily.

An explosion took place the 29 ult., in the purifying room of the Lansing, Mich., Gas Works, demolishing a a part of the roof and throwing down a portion of the walls. It is supposed that there was some leakage in the purifier, and by some means it came in contact with flame.

The ordinance passed Jan. 23 by the New Orleans Council, granting to the Louisiana Light and Heat Producing and Manufacturing Company the right to erect gas works for manufacturing naphtha gas, forbids the company to discharge refuse of any kind into the Mississippi River, or to keep a supply of naphtha for more than one day's use.

Mr. Charles W. Hinman, State Gas Inspector, has presented his annual report to the Legislature of Massachusetts, from which it appears that 7,766 meters were inspected in 1882, and 127 about which there were complaints brought to the Inspector's office. Forty-one of these latter were found to be fast, the average being .04+; 62 were within the legal limit of two per cent, averaging .026 fast; 21 were slow, averaging .113; three would not register. The average of the 124 which registered was .0043 slow. The average for eleven years was .0065 fast. These were all dry meters. During 1882 were made about 450 inspections of gas, showing the following average candle powers. English candles made expressly for the purpose were used in testing. Boston, 19,13; Fall River, 16.55; Holyoke, 17.43; Lowell, 17.67; Springfield, 17.22; Worcester, 16.22. Only six places in the State rank higher than Boston. These are Southbridge, 22; Great Barrington, 27.1; Amesbury, 27.3; Leominster, 28.8; Lexington, 30.2, and Chicopee Falls, 40.4.

STARTING COAL FIRES.

Mr. Ernest Hart, Chairman of the Committee of Council of the Smoke Abatement Institute, writes to the London *Times*, giving directions to English people about burning anthracite coal. A few of them may be useful to American housekeepers.

The coal should be put on the fire lightly in pieces about egg size. Fires should be replenished with moderate quantities and before they get too low.

The coal should never be stirred with the poker. The ashes from the bottom of the fire should be gently raked out; the coal requires as much air as possible.

For kitchen use, no saucepan or kettle should be put to rest on the fire; they should be rested just above the fire, as the coal will not bear weight.

Grates or stoves with fire-clay sides and back are best adapted for burning coal, but it will burn in ordinary iron grates with attention to the above rules.

The cinders of the coal can be used, and make a bright fire if they are sifted quite free from ashes. The cinders are particularly useful in lighting fires.

To light a fire readily a good quantity of wood is required; a little of the ordinary description of coal (soft coal) to start the fire is useful. A red hot iron or "salamander" taken from one fire and inserted under the wood of another kindles it very readily.

A new steam car for street railways, manufactured by Kitson & Co., of Leeds, has made a successful trial trip at Birmingham, England. Its average speed was eight miles an hour, and it was started and stopped with ease, and did not frighten horses.

The city of Birmingham, England, has taken proceedings to compel certain towns above it on the River Thames to refrain from polluting the river. A scheme has been prepared by the local authorities of Wednesbury to unite four districts in South Staffordshire in one sewerage system and to purify the sewage. The estimated cost of the project is $350,000.

Mr. Neujeuen, of Liege, proposes to purify sewage by passing it through the basic slags of the Bessemer process, and has formed a company to work his patent.

Citizens of Dalhousie, Can., who have been annoyed by odors from the gas works, have determined to take legal proceedings to ascertain the liability of the gas company.

Dr. Edwin M. Snow, Health Officer of Providence, R. I., submitted to the Board of Aldermen, the 30th ult, a recommendation that quarantine be maintained against vessels from Baltimore, on account of the prevalence there of small-pox. The Aldermen passed a resolution to carry the recommendation into effect.

A water back explosion of extraordinary violence occurred not long ago in Montreal, apparently due to stoppage of the water back connections. For some days before the accident there being no water to be had, range men were sent for who put it in what was supposed to be good condition. The explosion took place soon after the fire had been started for breakfast. The range was shattered, a piece of iron driven through a zinc partition between the kitchen and the dining-room. The servant who escaped alive explained that "she was going from the stove to the water-tap when the place seemed all a kind o' 'luminated like, and a piece of something gave her a puck on the shoulder and made her spin round."

BOILER CIRCULATIONS.

ST. JOHNSBURY, VT., *Jan.* 25, 1883.

To the Editor of THE SANITARY ENGINEER:

In Vol. 5, No. 6, dated Jan. 5, 1882, I find an article from S. L. B., Boston, Dec. 10, 1881, in regard to "Taking Return Below Boiler," in which the writer thinks it is an impossibility to do so, on account of getting a trap where the pipe rises, etc. When I had my boiler set, in connection with kitchen range, for various reasons I had it placed in my side hall, which opens into the kitchen. On account of length of pipe (some 40 feet) from boiler to pantry, and bath-room, it was necessary to draw a great quantity of water before we could get it hot. In reading the article referred to above, I came to the conclusion that it was worth trying to get the circulation, and I had the same arranged as per accompanying diagram, and am very happy to say, that it works to a charm, the circulation pipe from the pantry down into the cellar and up into the water front, being at all times warm. In making the connection in the cellar, marked *A*, with circulation pipe and lower water-front pipe, I took the precaution to make a check valve, by simply burring out the top of the soldering nipple, where the lead pipe connects with the iron pipe, and placing a common marble on top. Perhaps this is unnecessary, but I thought it would be well enough to take that precaution. You will notice a peculiar thing in the arrangement of taking the hot water pipe from the top of water-front, and carrying it over the door and then down into the boiler. It takes some time to get the circulation started, when I first start the fire and everything is cold; but once to going it works finely. In placing the boiler in the side hall I find that the radiation of heat from same keeps the hall comfortably warm during our coldest weather (thermometer stands at 30° below zero this morning). I have an idea in practical use, of heating a conservatory by hot water through contact of 1¼-inch iron pipes and outside of fire pot, of a Boynton hot air furnace. It works nicely, and is pronounced by florists to be the best thing of the kind known. If you should see fit to notice this in your paper, please send me a copy, and oblige,

Very truly yours,

CHARLES S. HASTINGS,
Paymaster, St. J. & L. C. R. R.

NUMBER OF WATER CLOSETS REQUIRED.

To the Editor of THE SANITARY ENGINEER:

In putting in water closets for a large factory in an eastern city, employing in one large building perhaps 300 hands, about one-half of whom are women, the question arose how many water closets would be needed. Will you please inform me whether sanitary engineers have adopted any ratio for such or similar cases? I have thought that perhaps your city Board of Health may have considered the question in connection with your densely populated tenement houses, and if so, would like to know their regulations in the matter. Also, whether under such circumstances, as all the closets will be on one soil pipe, *i. e.*, arranged directly over one another in a shaft or annex, and will be flushed with two gallon flushes from cisterns—a 5-inch drain pipe, iron, running some distance with a fall of one in forty will be sufficient to take care of the wastes and occasional foreign bodies thrown in by carelessness, without risk of obstruction? An answer will oblige,

Yours very truly, BUILDER.

[We think you would require at least 10 water closets—five for each sex. The pipe proposed is large enough. It should be provided with hand hole screws to admit of the removal of obstructions. You do not state how many operatives will be employed on each floor. Our rule would be to provide one closet for each 30 operatives on a floor.]

WHO SHALL PAY?

To the Editor of THE SANITARY ENGINEER:

My firm occupy the basement story of a large commercial building at a high rental. Our landlord is close, not to use a stronger phrase. Our plumbing was wretchedly bad, and we overhauled it entirely at a cost of several thousand dollars at our own expense, carrying a 4-inch vent six stories to the roof. This was a year ago. Now, the owners have decided to add two stories to the building and the question arises who is to pay for extending our air pipe the thirty additional feet? Must we do it or the landlord? BEACON STREET.

[If your Board of Health requires the pipe to go above roof, and it now does so, and subsequently another party adds stories to the building, we should say that he must make good any violation of the law or of your rights—assuming of course there is no special agreement between you affecting this question.]

TO PREVENT LOSS OF SEAL BY MOMENTUM.

AUBURN, N. Y., *Feb.* 1, 1882.

To the Editor of THE SANITARY ENGINEER:

It has been shown that a large amount of water poured into an ordinary S-trap, may, by mere momentum, destroy its seal. It has been observed, further, that when traps are ventilated sufficient water is sometimes forced up the ventilating pipe to restore the seal by falling back again into the trap. I enclose a sketch of an appliance intended to take advantage of this fact, and thus preserve the seal

from destruction by *momentum*. When the discharge occurs, water will (I should think, for I have not had time or apparatus for experimenting) rush up the "diverticulum A in sufficient quantity to seal the trap when the discharge is accomplished.

A CONSTANT READER OF YOUR JOURNAL.

[We do not think the benefit to be gained would compensate for the expense and possible complication arising from the presence of this extra pipe. Under a wash basin the risk alluded to is slight, and the branch pipe would in time be stopped up with filth, and be of little practical use.

FRESH AIR INLETS.

NEW YORK, *Jan.* 26, 1883.

To the Editor of THE SANITARY ENGINEER:

Will you be kind enough to let me know, through your paper if it makes a good job to connect the fresh air inlet from house side of trap and bring out in front area within four feet of front of house to act as cesspool?

P. MARTIN.

[If our correspondent means the using of the grating over the ordinary area cesspool trap (the trap part to be removed) as the terminous of the fresh air inlet, we would say that we should apprehend no annoyance from it, though four feet is rather nearer the house than we should care to have it.

To answer this question properly a person should be familiar with the location. The best place to terminate a fresh air inlet can only be decided after a full knowledge of the surrounding conditions.]

LEAD PIPE.

PHILADELPHIA, *Jan.* 11, 1883.

To the Editor of THE SANITARY ENGINEER:

What is considered the best receipt for coating a lead-lined tank to preserve the lead and prevent sweating?

By giving the above your attention you will greatly oblige, Yours, etc., WILLIAM H. DOYLE.

[Pure waters act upon lead more energetically than those containing carbonates. Water containing carbonates will form a carbonate of lead coating in the tank and so prevent or retard the solution of the lead. We know of no instance where this has been practically applied. By the sweating in this case we presume you mean the condensation of water on the outside due to the lower temperature of the water as compared with that of the surrounding atmosphere. This cannot be helped, and in good work safes are provided under the tanks to catch this water of condensation.]

To the Editor of THE SANITARY ENGINEER:

Will you please throw light upon the following: In a discussion about the sewerage of a town near New York city, some advocated the putting of a double trap on the house drain, as has been recommended in case of pressure in the sewers. It was objected to this that if two or more traps were placed on the same drain syphonage would be sure to occur. Now can the presence of one trap on the horizontal house drain, or on any other pipe, affect other traps? Probably these parties were thinking about several fixtures emptying into one soil pipe, and got things mixed. Still, some of them will see your reply; it may do good.

W.

[The presence of a trap on the main drain does not affect the other traps in the matter of syphonage in the slightest degree. We should object to the presence of two traps on the main drain, except in special cases, *i.e.*, where through defects in the public sewers, a back pressure was likely at times to occur. Of course it will be understood that a vent pipe must be run from between the two traps when used.]

If A. H. B., Philadelphia, will give us some clue to his identity, by sending his name, his letter about a horizontal boiler with an answer will be printed in THE SANITARY ENGINEER.

Will J. J. H., of St. Paul, Minn., please send us his name, that we may answer his question about boiler connections.

Digitized by Google

THE WASHINGTON PLUMBING REGULATIONS.

WASHINGTON, D. C., *Jan.* 25, 1883.

To the Editor of THE SANITARY ENGINEER:

Enclosed please find a copy of the revised plumbing regulations for this city, which went into effect on the 1st ult., and were published in the *Evening Star* on the 3d inst.

I also enclose a copy of a communication from Mr. Edward Caverly (a master plumber of this city) which appeared a few days later in the same paper.

The Master Plumbers' Association of this city subsequently, by resolution, endorsed the communication of Mr. Caverly in every particular; and also ordered a copy of same, and action taken by the Association be sent to your journal. Very respectfully, yours,

E. G. LANSDALE, *Sect'y.*

2134 PENN AVE., N. W.

"*To the Editor of the Evening Star:*

"As there appeared in the *Star*, of the 3d inst., an article putting forth in detail the amended plumbing regulations for this district, which went into effect on the 1st ult., I would call your attention to some of the comments upon the same as not being sustained by the facts in the case. It is stated that the "original regulations were the result of many patient conferences between the health officer, plumbing inspector and all the leading plumbers in this district." The plumbers should have been left out, for they are neither responsible for any of the mistakes or impracticable features in the old regulations, or the excessively high-priced work called for in the amendments. They have had no voice in the matter whatsoever. Immediately after the passage of the act creating the office of inspector of plumbing, the plumbers received an invitation to meet the health officer in council. They cheerfully responded, and the trade was well represented at a meeting, held at his office, and there a committee of seven was selected to pass upon certain regulations which the health officer *was about to issue*, and which, in the main, were *identical with those then in force in another city governing the same subject.*

"After several meetings of the committee, a report was made to the health officer, which, while it sustained many of the prominent features of the regulations as submitted, suggested certain changes or modifications in others. The end of the matter was that the health officer not only ignored all the suggestions made by this committee, but he did not even extend to it the courtesy of an acknowledgment of the receipt of its report or the letter to him accompanying the same.

"Many of the clauses in the original regulations were bad enough, and the amendments in some respects are worse, and, without much doubt, these regulations will have to be amended again, unless the courts sustain a most unwarrantable exercise of power over private rights, which even a board of health is not usually vested in by law. A few more changes in the same direction will finally place plumbing work in the line of luxuries available only to the rich and well-to-do.

"The statement that, since December 1st, the regulations have been strictly enforced is far from the mark. With one inspector only for this district, and he obliged to remain at his office till 1 P. M., it requires no argument whatsoever to show that it is simply impracticable for him to see these regulations strictly adhered to by all parties in a field so wide as the District of Columbia.

"Very respectfully, yours,

"EDWARD CAVERLY."

1425 NEW YORK AVENUE,
WASHINGTON, *Jan.* 6, 1883.

The regulations governing plumbing are as follows:

TRAPS AND MAN-HOLES.

A running trap shall be placed on every main drain at an accessible point, and a man-hole, with suitable iron cover, shall be constructed over the trap to admit of cleaning the same.

Every main drain shall have an inlet for fresh air, entering on the house side of trap, and carried to such point as may be approved by the inspector.

When necessary to lay a soil pipe under a building, such pipe shall be of iron with leaded joints, and shall be so located as to be readily accessible for inspection. Such pipes shall be kept above ground, if practicable, shall be not less than four (4) inches in diameter, and shall extend above the roof of house; this extension shall be at least four (4) inches in diameter.

Where pipe passes under walls of house there shall be a relieving arch to prevent pipe being broken by settling of brick work.

IRON PIPES.

The weight of all iron pipe used under ground shall not be less than: For 6-inch pipe, 20 pounds per lineal foot; for 5-inch pipe, 17 pounds per lineal foot; for 4-inch pipe, 13 pounds per lineal foot; for 3-inch pipe, 9½ pounds per lineal foot; for 2-inch pipe, 5½ pounds per lineal foot.

All iron, soil and sewer pipes shall be coated inside and outside with coal tar applied hot. All changes in direction shall be made with curved pipes, and all connections with Y branches and one-eighth bends. All connections of lead with iron pipes shall be made with brass thimbles, full size of iron pipe, caulked into the iron hub, and plumbers' wiped joints.

Sub-soil drains shall be provided whenever dampness of site of any proposed dwelling is known to exist. These may be of terra cotta, not connected with sewers, but discharge into a man-hole over running traps, and have a back water valve.

No vault, sink, cesspool or dry well shall be in any way connected with the drainage system of any house, and all vaults, sinks, or cesspools must be water tight.

Rain water leaders when placed inside of any house shall be of iron, with leaded or screwed joints, and when opening below or near any windows shall be effectually trapped.

No brick, sheet metal, or earthenware flue shall be used as a sewer ventilator, or trap vent.

All soil, drain, waste and supply pipes shall be concentrated as much as possible, protected from exposure to frost, and shall be so located as to be readily accessible for inspection.

Every soil, drain or waste pipe inside of the building line, and five (5) feet exterior thereto, shall be of iron.

No trap shall be placed on or at the foot of vertical soil pipes so as to impede circulation of air.

All water-closets, sinks, basins, wash trays, etc., shall have suitable and approved traps placed as near as practicable to said fixtures.

Each and every trap shall have a *special* vent pipe of iron, extending either above the roof of house, or into the soil pipe above the highest fixture.

The vent pipe for each water closet trap shall be not less than two (2) inches in diameter, and for traps under other fixtures not less than 1¼ inches; but if exceeding ten (10) feet in length this pipe shall be not less than one and one-half (1½) inches in diameter.

Waste pipes from bath tubs, wash stands and sinks shall not be connected with the trap of a water closet.

There shall be no direct connection of water closets above basement floor with service pipe.

FLUSHING PIPES.

Means for thorough flushing of all soil pipes, drain pipes and water closets shall be provided in every case.

Where water supply is not ample for proper flushing of water closets, etc., the inspector of plumbing may, in his discretion, order the erection of a tank or cistern into which water may flow at night, or into which it may be pumped.

Cisterns or tanks erected for purposes described in the foregoing paragraph shall not have an overflow pipe connected with any drain, and water supply for domestic purposes shall not be drawn therefrom.

All safes and refrigerators shall be drained by special pipes not directly connected with the house drain or main sewer.

Wooden wash trays and sinks are prohibited inside of buildings; they shall be of non-absorbent material.

The inspector of plumbing shall be notified promptly in writing by the plumber, and upon blank forms to be provided for that purpose, when the plumbing work on any house is completed and ready for inspection. All inspections shall be made as soon as possible after such notification, and the pipes shall be tested by filling with water. No part of the plumbing work of any house shall be covered, or in any manner hidden from view until after such inspection shall have been made, and a certificate of approval issued by the inspector.

The inspector shall promptly condemn and order the removal of any defective material, or any work done other than in accordance with the provisions of these regulations.

Prosecution for infringement upon the provisions of these regulations shall be made by information filed in the Police Court in the District of Columbia.

These regulations shall be subject to alteration or amendment at any time.

In making their approval the commissioners state that it is required that permits shall be kept at hand during the progress of the work to which they relate, and be exhibited whenever required by the proper officers of the District. The police are instructed to arrest any one found making an excavation in the street, or making any sewer connection without permits.

[We fail to see anything in the Washington plumbing rules to justify Mr. Caverly's letter, or the Master Plumbers' Association's endorsement of it. Indeed, we regret to see both. To a casual reader the letter leaves the impression that the complaints are made because there is a restriction on doing cheap work, which is only another name for skin work, of which Washington has had its full share. It is doubtless true that to properly enforce the rules more inspectors are needed, but that is also true of every city. Instead of making complaints such as we present, and talking about "plumbing only for the rich," which is the skin builder's argument everywhere, the master plumbers of Washington should do what they can to sustain the law and render all the assistance possible in its enforcement. The time has gone by for any set of men calling themselves plumbers to oppose the enforcement of reasonable plumbing regulations, and although we might differ on the question of expediency of some details, yet we see no justification for characterizing the Washington regulations as unreasonable.]

THE PLUMBING OF MR. C. VANDERBILT'S RESIDENCE.

WASHINGTON, D. C., *Jan.* 9, 1883.

To the Editor of THE SANITARY ENGINEER:

Your series of illustrations and descriptions of the sanitary arrangements in the Vanderbilt residence have been instructive and interesting. However, we have frequently been moved to offer criticisms thereon, but feeling some delicacy have let them pass. In your issue of Dec. 28, you show the arrangement of slop sinks so objectionable that we will notice it.

The illustration shows a 4" trap. As these sinks are receptacles for chamber slops, spittoon and nursery waste and the d—l knows what, the contents of these 4" traps is quite as offensive and not less dangerous than the matter contained in traps under water closets. These sink-traps cannot be flushed, and will become loaded with filth. The traps are set below the floor with about 2 feet of 4" pipe above the water line—a kind of a dry receiver which will soon become degraded with putrefying accumulations. These conditions being anticipated the plumber (or architect?) has planned a ventilator (alack the term!) consisting of a tube *K* extending through the roof. Usually the air will come down this tube and ventilate the stinking thing all into the house.

Why use anything larger than a 1½" trap under a slop sink? These, if set close up to the sink, may be kept clean.

Hand-hole plates are dangerous, and their use should be restricted to positions controlling junctions in long lines of soil or waste pipe. Usually a 2" hole is as good as a 4" hole. We would limit this hand-hole business to 2" brass screwed plugs and never use them near fixtures which may be removed for access to pipe in the improbable event of a stoppage requiring it.

Perhaps the plumber is not to blame that "the space under the sink and above the safe is not accessible except by unscrewing the wooden casing in front," or that "wooden doors slide down in front of the sink, hiding it entirely when not in use." We did not suppose such things permissible in these later days. It seems to us that a wainscoting of slate or tile as high as the sink back on which all the pipes would show, and a flooring of slate with a short safe pipe set so as to discharge into the sink next below—with all the wood casing omitted—would be much nicer.

It should be borne in mind that three or four stories of 1¼" safe pipe with openings on each floor, and which occasionally receives filthy water or perhaps urine, is an active-factor of bad smells, even if its discharge end is sealed. Safe pipes are for emergencies, and should run separately, terminating at the nearest safe point. Lead linings in close places smell bad—slate for floors is far preferable.

These slop sinks appear to have a line of 5" soil pipe, a line of 3" vent pipe, a line of 1¼" safe pipe and the ventilating pipe, *K*. Is this good practice? We would prefer no trap larger than 1½", and no waste larger than 2"; with 1½" vent for traps and without the ventilating pipe *K*.

The garbage box is the place for old shoes, broken bottles and decayed vegetables, and the waste pipes should not be expected to take the place of the scavenger's cart. We do not think waste pipes of 2" with 1½" traps are more frequently stopped up than 4" pipes with 4" traps.

This criticism refers to slop sinks having no adequate provision for flushing. Of course, where a flushing tank is used there is no objection to a 4" discharge trap, but a trap 4" in diameter cannot be flushed by a ¾ draw cock, and the contents of the trap will be whatever was last dumped into the sink.

Respectfully, H. & H.

In order to give the gentleman who did the plumbing in this residence an opportunity to reply to H. & H.'s criticisms, we showed him the above letter, and have received the following reply:

To the Editor of THE SANITARY ENGINEER:

Your Washington correspondent finds fault with the arrangement of the slop closets fitted up in Mr. C. Vanderbilt's house. He says that these sinks "are receptacles for chamber slops, spittoon and nursery slops, and the d——l knows what," and that "the traps cannot be flushed, and will become loaded with filth, soon becoming degraded with putrefying accumulations." If he will but glance at the diagram and description, he will find that these sinks are made of enameled iron, having an 8-inch strainer over a cone-shaped pipe, tapering down to four inches at the point of connection with trap.

Digitized by Google

Immediately beneath the 8-inch strainer the ventilating pipe is connected, and thence is carried to and through a light shaft, used to light the servants stairway, to and through the roof of building and surmounted by a ventilating cap, similar to one which is placed over the light shaft spoken of. These sinks are also capped with slate all around, securely set in cement and secured by screws, thus preventing any slop over into the safe waste, which he fears may "be a cause of bad smells." If he will examine the diagram closely he will find that the shape of the sink combined with the cone-shape pipe, causes the water to thoroughly flush all sides of the pipe, as well as the rim of the closet bowl does to a water closet. As to using a 1½-inch waste from a fixture designed for use as these are, the experience of the plumbers of this city certainly would not warrant them in any such thing (unless, indeed, they were short of work and had no reputation to lose), for it would certainly necessitate an almost daily attendance of a plumber to remove the cigar stumps, nursery waste, and—as he remarks more forcibly than politely—the d——l knows what. And just here another of his points comes under notice, as to the trap screws, or, as he expresses it, "hand-holes." No person at all familiar with plumbing work will deny that if one or more of these "hand-holes" are improperly put in, they may, and do emit sewer gas; but put in by a good *mechanic*, as these are, with rubber washers and brass screws, there cannot possibly be the least danger. As for the air being driven from the vent pipe into the room, even if it could be so, what would this air be but the outside air, which is certainly pure? This pipe being carried through the light shaft, which is heated from the lower stories, causes the pipe to be always warm, causing an upward draft. This system of ventilating soil pipe has been thoroughly tried and not found wanting. Yours very truly,

ROBERT ENNEVER & SON.

"WHAT GOOD CAN BE ACCOMLISHED?" IS THE QUESTION ASKED.

To the Editor of THE SANITARY ENGINEER:

With your permission I desire through your paper, taken as it is by every plumber in Philadelphia, to answer the above.

This question is asked of a committee of seven plumbers, appointed, with a like number of physicians and architects, to arrange for and present to the citizens of Philadelphia as near a perfect system of drainage, and ventilation of traps and soil and waste pipes, as in their best judgment they could; if this only is accomplished, we may consider the effort successful.

But we have as plumbers a higher aim, and that is to elevate the plumbing trade, masters, journeymen and apprentices, to a higher standard than it has ever before occupied.

Plumbers, with some exceptions, are to-day mere machines; and although they may be good machines, they cannot run or do their work, unless a power of some kind starts them.

What we want is educated plumbers, either in the place of masters, journeymen or apprentices; exercising the brains God has given them, in every way and on all occasions, whenever an opportunity offers; to advance themselves and elevate the trade.

It is useless to expect the confidence of those who employ us, unless we understand perfectly our business, and are gentlemen in the truest sense of the word; I do not mean measured by broadcloth, but in principle and action.

If masters, giving our customers full and perfect value for the pay we receive. If journeymen, doing our work in the very best manner and to our employers' interests. If apprentices, understanding that application and attention to whatever we are directed to do will secure for us in the end the master's place.

In a word the object we wish to accomplish is perfect and satisfactory work to the citizens of Philadelphia and ourselves; if this be accomplished, and there is no doubt but that it will, much good will result.

In conclusion, will you as plumbers do your part in this work? Yours respectfully, "One of the Seven,"

Jan. 29, 1883. JNO. WORTHINGTON,
1721 Chestnut st., Philadelphia, Pa.

[A comment on this letter will be found in our editorial pages.]

A CORRECTION.

OFFICE OF THE STATE BOARD OF HEALTH,
ALBANY, N. Y., *Feb.* 3, 1883.

To the Editor of THE SANITARY ENGINEER:

As my attention is called to an incorrect statement on the first page of THE SANITARY ENGINEER of the 1st inst., in which it is reported that the State Board of Health has recommended that a "certain number of towns in Schuyler County should be quarantined," etc., permit me to inform your readers that nothing of the kind has occurred.

Precisely the opposite of any such advice has been given. Small-pox killed a man in the town of Hector on the fourth day from the attack. Upwards of 100 people had been exposed to the contagion before its nature was suspected. Immediately upon receiving information of the case the State Board's Secretary notified the sanitary authorities in eleven towns and four large villages to organize and go on with the duty of vaccination as rapidly as possible, and, at the same time, giving assurance that by so doing they would avoid quarantining against any town. The towns and villages so notified have performed their duty well and with despatch and willingness. The domestic quarantining of the sick has been rigorous and reasonable, and the only extended *cordon* I have heard of was in the case of a prominent citizen of Ulysses who contracted the contagion upon the premises of a dying friend ten miles away. In the moment of local panic a constabulary *cordon* was maintained for a brief period.

In two weeks the entire population of eleven large towns was more effectually vaccinated or re-vaccinated than I have ever before known a like number of people to be, and this by the authority of local boards of health and the coöperation of school officers. This protective work was signalized near its close, by the use of 430 vaccine slips at the Cornell University.

It is to be hoped that no medical or sanitary journal will repeat the absurd statement that has elicited this note,

Respectfully,

ELISHA HARRIS, *Sec, S. B. H.*

[Our statement that it was "reported that the State Board of Health had ordered certain towns quarantined" was based on the following extract from a dispatch to the *New York Tribune* from their regular Albany correspondent who, in alluding to an outbreak of small-pox in the State, said: "The mischief had been done already, however. Among the visitors on Compton, had been an old cattle drover named Abell. He was prostrated by small-pox soon after Compton's death. Many other persons who had visited Compton's house were taken sick either with small-pox or varioloid. Three persons died of small-pox in Compton's own family. The local Board of Health swiftly informed the State Board of Health of the outbreak and received orders to quarantine the town and neighboring towns. Acting under these orders twelve towns about the town of Hector have been quarantined. The alarm felt about the disease is also felt in the towns of Yates County on the opposite shore of Seneca Lake, and these have also been quarantined. Much apprehension is felt in the region that the disease may spread, but the vigorous measures taken by the State Board of Health and the local health authorities it is believed will eradicate it. There were twenty-one such outbreaks of small-pox in the State last year and all were subdued by the State Board of Health. The towns of Tompkins County adjoining the town of Hector in Schuyler County have also been quarantined. Naturally, there has been universal vaccination in Ithaca as well as in the farming regions about it."]

POLLUTION OF THE SCHUYLKILL.

PHILADELPHIA, *Jan.* 23, 1882.

To the Editor of THE SANITARY ENGINEER:

The reason of the bad water in the Schuylkill just experienced (which has now improved), is not such a mystery as might be supposed, as will be seen from the enclosed letter of Chief Engineer McFadden.

Two of the dams drawn *off* receive the sewage of Reading, as well as some of the impurities deposited by the daily precipitation of sulphate of lime, the result of the combination of the lime water from Maiden Creek with the sulphate of iron solution from the mining region.

With this natural neutralization going on daily, almost before their eyes, it is singular that the people of Gilbertson quoted in your last issue, as well as others in the mining region, have not, before this, availed themselves of the *lime cure.* Yours truly,

CHAS. G. DARRACH, C.E.

DEPARTMENT FOR
SUPPLYING THE CITY WITH WATER.
COR. 13TH AND SPRING GARDEN STS., N. Y.
PHILADELPHIA, *Jan.* 13, 1883.

MR. J. R. CUMMINGS, *Chairman of Water Committee:*

An unusual series of contingencies have conspired to cause the bad water from which we have been suffering.

First, the small rainfall in October, November and December, and very small flow of the river.

Second, emptying the Schuylkill canal and eleven dams thereon.

Third, ice covering the water converting the river into a closed channel and preventing ventilation of the water.

The following facts have been collected from Jas. F. Smith C. E. of the Reading canal, and other gentlemen living in the Schuylkill Valley, as well as my own observations.

The rainfall during October, November and December 1882, was four and one-half inches, one-half the usual amount or eight inches; in 1881 it was ten and one-half inches, and the flow of the river is much less than the usual minimum (scarcely more than the low water of summer).

The entire Schuylkill canal as well as nine dams between Schuylkill, Hoven and Blue Mountain, and two dams below Reading have been drawn off; the first nine were drawn December 18 to 23, and the last two December 29 to Jan. 1.

The six dams between the Blue Mountain and Reading, have been covered with ice since the middle of December, about six inches thick.

The six dams above Fairmount have been obstructed by ice since December 4 from two to five inches thick.

The deductions drawn from these facts are: the impounded water drawn from the dams and canals, undiluted by the usual rainfall, flowing under the ice, and only *over* twelve of the dams on the river, has deprived the water of its usual aëration, and prevented the influence of air, sun, light and motion to dissipate the gases.

From experience I have but little faith in any analysis other than that which takes into consideration the amount of oxygen held in solution.

In conclusion I would say that the water is better, and my impression is, that the bad taste will gradually improve.

Hoping this will answer your request and allay the fears of the public,

I am yours truly,

WM. H. MCFADDEN, *Chief Eng'r Water Dept.*

A REQUEST FROM PHILADELPHIA.

PHILADELPHIA, *Jan.* 25, 1883.

To the Editor of THE SANITARY ENGINEER:

As subscribers to your paper, you would oblige us by publishing the following. The call of Philadelphia plumbers to devise means and frame rules for the proper execution of plumbing work, has thoroughly stirred up the question, and nearly all the plumbers are in favor of some law to regulate plumbing work. There are some fine plumbers in Philadelphia, and we are pleased to see effort made to establish a law that will protect them. If we had been present at the meeting called some weeks ago, we would have proposed Mr. H. J. Burke, one of our leading plumbers, a master mechanic, of thirty-three years' experience, who would do credit to Philadelphia plumbers, as one of the committee. In looking at one of his drawings lately, we found a plan that would do any expert good to examine. It is the best and safest plan we have yet seen. We trust that the committee will appoint practical plumbers to represent us, so as to exchange our views with the plumbers of New York, and elsewhere.

Res'py, P. TOLAND,
J. W. WOILT,
ANG. BREEN.

PLUMBING LAW VIOLATIONS.

The number of violations of the Plumbing Law reported to the Board of Health of this city in the week ending Saturday last, is greater than usual, but most of them are not of a serious character. Inspectors Hollick and Hooper report seven each, and Inspectors Elliot and Eagleson one each.

Bills to compel hotel owners to put up fire escapes are staple articles of legislation in various States just now, but any hotel which has to be compelled to take this precaution is a good hotel to sleep outside of.—*Philadelphia Inquirer, Jan.* 1883.

NEW YORK STATE BOARD OF HEATH.

RULINGS AS TO MIXTURES.

We last week published a list of exemptions or standards that the New York State Board of Health had adopted under the Food and Drugs Act, then awaiting the approval of the Governor.

These rulings have produced no little excitement among manufacturers and dealers of food products, and mainly because it is proposed to require that the proportions of each mixture be stated on the label. They hold that this is a needless interference with trade, and practically makes public the results obtained by experience, the benefits of which belong to the manufacturer.

So long as the adulterants are kept within the limit fixed by the Board, it is held that no public good is to be gained by the publication of proportions.

The English law recognizes this fact, and does not require that proportions shall be stated. We think it right that the label should guarantee that the amount of pure article required by the Board is present; also that the names of the constituents should be stated, but not the relative proportions. In fact this is an important question, and we should like the views of our readers on it. We believe that some good can be accomplished by an avoidance of extreme measures, and that the Board should do all they can, consistent with their duty, to avoid unnecessary antagonisms.

PROSECUTIONS UNDER THE FOOD AND DRUG LAW.

The trial of druggists and grocers for selling adulterated articles, was resumed at the Court of Special Sessions, in this city, last Monday, and two cases disposed of.

John O'Connor, a grocer, of 838 Tenth ave., was charged by Inspector Colby, with selling one pound of coffee which was adulterated with 15 per cent. of chicory. He plead guilty, but said that he bought the article for pure coffee. As his store was a small one, he was fined only five dollars.

George Cutts, a druggist, of 508 Third ave., charged with selling one ounce of "precipitated sulphur" adulterated with over 30 per cent. of sulphate of lime, plead not guilty, but was found guilty by the Court and fined ten dollars.

THE NATIONAL BOARD OF HEALTH.

On the 26th ult., Mr. Harris, of the Senate Committee to investigate and report on the best means of preventing the introduction and spread of epidemic diseases, presented the report of the Committee recommending the repeal of sec. 10 of the Act of June 2, 1879, by which the powers conferred on the National Board of Health under that act would expire June 2, 1883. The Committee's report contains a summary of the history of the National Board of Health, especially in its relation to the yellow fever epidemic of 1879.

Reciting the course of the epidemics of that year and the preceding, the Committee go on to say that the experience of the country then gained has "inspired great confidence in the South and Southwest in the possibility of effectually preventing, or successfully dealing with and controlling, these epidemics. The great transportation companies of the South, both river and rail, are unanimous in their approval of the action and methods of the National Board in dealing with such cases, because experience has shown that they give the necessary security against the spread of disease, without stopping, or retarding to any considerable extent, commercial intercourse.

"They have learned from their own experience that the certificate of the National Board of Health as to the sanitary condition of any city, or place, is accepted by other cities and States as testimony coming from a strictly impartial and well-informed authority, independent of all local interests or influences, commercial or otherwise. The action and methods of the National Board have been approved by the State and local boards of health throughout the country, almost without exception, by the American Medical Association, the American Public Health Association, the National Academy of Sciences, the transportation companies of the South and Southwest, boards of trade, cotton exchanges, and other associations of business men throughout the country. In the opinion of the committee, the Board has accomplished much, and is capable of accomplishing highly important results of great benefit to the country, results which can be accomplished by no other agency.

"We have had State and municipal boards of health for very many years in the past, but we have also had epidemics of imported contagious and infectious diseases not unfrequently within the same period. If we could prevent these epidemics, we must have a general system applicable to every port through which contagion can be imported, uniform in its requirements in respect to quarantine, and rigidly enforced, without regard to local commercial interests or influences, and the time for greatest vigilance in the enforcement of these preventive measures is when the country is entirely free from these diseases.

"But even when they have appeared, the experience of 1879 has shown that, with proper care and effort, they can be confined within narrow limits, if not stamped out entirely. But to do this requires prompt action, and an amount of means rarely, if ever, at the disposal of a municipal or State Board of health."

After reciting at some length precedents to justify legislation by Congress for the establishment of general quarantine regulations, and the control of commerce to prevent the conveyance of contagion, the report of the Committee closes in the following language:

"If it be admitted, as it is believed all must admit, that the action and operations of the board even tend to the preservation of life and health to any, however small the extent, such fact makes it eminently worthy of our support, and in the opinion of the committee it should be sustained with such powers and means as will enable it to perform its functions fully, promptly and efficiently.

"When the memories of the fearful ravages of the epidemic of 1878 were fresh, both houses of Congress were ready to appropriate, and did appropriate, all that the committee asked, for the purpose of endeavoring to find, if possible, a means of preventing the recurrence of this terrible scourge; but as the memory of the hundred thousand sufferers and the twenty thousand new-made graves of that period are fading from our minds, the committee has experienced more or less of difficulty in obtaining the appropriations necessary to enable the board to perform the important duties which devolve upon it, and, indeed, found it impossible at the last session to obtain adequate appropriations.

"The practical question, as it appears to the committee, is, the country being now free from yellow fever and cholera, shall we use the necessary means to keep it so, or relax into indifference, withhold the powers and the necessary means to prevent their importation, and await the outbreak of another epidemic, which will cost the country hundreds of millions of dollars and thousands of the lives of our people, to awaken us to the importance of preventive measures in which the committee believes we can find absolute security?"

THE LOUISIANA QUARANTINE DECISION.

The New Orleans *Times Democrat* of Jan. 27 publishes the following extracts from a letter received by Dr. Chaillé from "one of the most distinguished practical Sanitarians in the North," which will be found of interest as regards the New York Quarantine.

"Judge Monroe's decision is of sufficient importance to merit a wide circulation. But you are doubtless aware that the same conclusion has been reached by several other courts, and I have no doubt it will be sustained by the higher courts and by distinguished lawyers out of court. For New York, in drawing the bill which was enacted into our quarantine law of 1883, I had occasion to go over the ground thoroughly with my friend, the late Hon. Hy. C. Murphy, at that time State Senator, and since that time with Charles O'Connor. There is a broad distinction between fixed fees established by the State to be paid a health officer for actual service in ascertaining the fitness of a ship to enter port without danger and quarantining her, and exacting pay as a revenue to the State, to be paid out subsequently for services rendered by a health officer or for any other purposes. Hence I have found that in the opinion of the distinguished lawyers above referred to, the special fees for the protection of the port—for actual service as practiced in New York—are legal, and so, too, whatever expense incurred by a ship, to render her admissible to pratique. Hence all attempts in New York to make the office of health officer a salaried officer and to charge and conserve fees to meet the salary and expenses (as in your case) have been overruled. The effort is just now again under discussion by fresh hands, Gov. Cleveland having suggested it in his message. But I have no doubt the result will be as heretofore. The same decision as Judge Monroe's was reached in Georgia four years ago, after a large fund had accummulated at Darien, under exactions similar to those of Louisiana. South Carolina last year passed the same kind of an unconstitutional law, on which I had occasion to write to Dr. Libby (health officer at Charleston), who was active in securing it, that it was unconstitutional."

NOTES FROM CHICAGO.

[From our Special Correspondent.]

CHICAGO, *Feb.* 1, 1883.

The regular meeting of the Master Plumbers' Association, this evening at their hall, No. 185 Clark street, drew out, despite the storm and the rush of trade, over thirty members, D. J. Rock, the President, occupying the chair and Alex. Murray, Secretary.

A vote of thanks to Professors Jackson and Angear, for their entertaining lectures the other night, was unanimously carried. Incidental expenses were only $60, and congratulation was hearty on the successful starting of the lecture course. At the next entertainment Allen P. Creque, of New York, was invited to speak on a new system of hydraulic and sanitary plumbing.

A communication from Philadelphia, signed by Weaver & Pennock, asked for by-laws, etc., with information as to organization, "as there is a movement starting to form a master plumbers' association in this city."

Some discussion followed favoring the formation of a National Plumbers' Association.

Regarding a communication from New York, reporting the appointment there and in Brooklyn of committees on protection, and asking for a Chicago committee on coöperation, action was deferred till next meeting, as there seemed some uncertainty as to what the joint committees were to protect.

After full debate, it was decided that the Secretary should keep a "black list" book, to be seen, added to, or amended only in open meeting, in which should figure those unworthy members of the craft "who willfully would do a bad job, be negligent of duty, habitually went on drunken sprees, and generally were botches."

The holding of a competitive exhibition of Master Plumbers' skill, at the Exposition Building, sometime in the summer, was advocated.

Finally, a committee, acting under instructions, will shortly submit to the press and public "the best mode of taking care of a heated water back, so as to further instruct the people as to their use."

Mr. J. B. McCallum, Borough Engineer, has submitted a report on the pail system in Blackburn, to the Sanitary Committee His conclusion is that the introduction of the pail system was of great benefit in reducing the number of offensive privies, but he is also convinced that any extension of the system means an increase of rates, as no process of manufacture "has yet been established which defrays the cost of collection and preparation of manure for sale." He reckons that if the whole of the contents of the pails, which deal with the excreta of one-half of the population, could be reduced at the Finnington works and sold, the annual loss would be about $20,000. The extension of the pail system beyond its present limits is opposed, and it is recommended that in buildings to be hereafter erected hopper water closets with waste preventing cisterns be used.

ENGINEERS' CLUB OF PHILADELPHIA.

At the meeting Jan. 20, President Henry G. Morris in the chair, Mr. Wm. E. Lockwood presented a full description of the Shaw Locomotive, profusely illustrated by magic lantern, working model, etc.

Mr. Wilfred Lewis exhibited a machine for the graphical determination of centre of gravity and moment of inertia of plane areas. The figure to be calculated is drawn to a suitable scale and placed in the machine, where the outline is followed by a tracing point in order to produce, upon another piece of paper, a figure whose area shall be proportional to the statical moment of the given figure about an assumed axis. If, now, the second figure be followed by the tracing point and a third figure be drawn, its area will be proportional to the moment or inertia; and from the areas thus drawn can be found, by simple arithmetical processes, the centre of gravity and moment of inertia. The machine is intended for application to such figures as cannot readily be solved by the usual methods, such as deck beams, steel rails, and castings, with round corners, large fillets and curved sides, which can only be approximately solved by long and tedious integrations.

LONDON SMOKE.—London has only about 24 per cent. of sunny days, while towns near by have, on an average 12 per cent. more.

Novelties.

Under this heading we propose to supplement our section on patents by descriptions and illustrations of new appliances put on the market. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity and probable interest to readers, and especially the fact that they have not been elsewhere described As a rule we shall make no comments, and IT IS TO BE DISTINCTLY UNDERSTOOD THAT A NOTICE DOES NOT IMPLY APPROVAL. *No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.*

MACHINES FOR THE CONSTRUCTION OF CONTINUOUS STONE PIPES.

The simple form of the machine described below was invented in 1879, by E. M. Hamilton and C. N. Earl, of California, and is said to have been extensively used since in that State, chiefly in the construction of drain tile and sub-irrigation pipe. Improvements have since been made by Wm. M. Clemens, of Michigan, whose patents, together with the rights to most of the Eastern States under the old patents, have recently been purchased by the "National Continuous Stone Conduit Co., of 62 William street, this city, who are about to place the machines on the market.

FIGURE 1.

They are designed for the construction, in the trench where they are to remain, of continuous artificial stone pipe, for drains, conduits, electric tubes, and other purposes for which underground pipes are used.

Figure 1 is a longitudinal, vertical section of the single pipe machine, in which the principle of construction and method of operation are most clearly shown. The body of the apparatus consists of a hollow cylinder, the inner diameter of which is the same as that of the outer diameter of the pipe to be made. The upper half of the front part of the cylinder is cut away, and the end of the remaining semi-cylinder turned up like a sled runner, and for the same purpose, for the whole machine slides along on the earth in the bottom of the trench as the construction proceeds, being propelled by the same power and motion used to form the pipe, and by its pressure and movement on the earth preparing a bed in which the pipe is to rest. At a point in the solid front end, on the line of the axis of the cylinder, is attached a rod which extends back beyond the centre, and has at its end a solid rubber cylinder, which is the core of the pipe to be formed, and hence of the same diameter as the inside of the pipe. In the top of the hollow cylinder, and just in front of the core, is an opening over which is fixed a feeding tube or hopper. Into this is put the plastic material (cement mixed with sand and water in various proportions, according to the objects of the pipe) which is forced back and made to fill the space between the core and the cylinder, by a piston called the "former," which is worked by a lever, as shown. The same stroke which compresses the material into the mold carries the whole machine forward the same length that is added to the pipe, while the rubber core or "follower" smooths the inside of the new section of pipe as it is withdrawn. In constructing drain tile, openings are made for the admission of water by drawing a trowel across the upper part every 15 or 20 inches, cutting nearly to the bottom of the opening.

Figure 2 represents a similar machine, but capable of making 12 tubes at once, all in the same piece of stone. Below the machine, on the left hand, is shown a cross section of the "former" belonging to this style, and beside it two different patterns. These many-tube styles are designed especially for electric underground wire carriers. It will be seen that every different size and shape of pipe requires a separate machine, but that any size (within limits), thickness, or arrangement is possible by making the formers and cores of the desired shapes.

FIGURE 2.

Construction Notes.

BOSTON.—The Water Board has recommended a 48-in. water main from Brookline Street to Westchester Park. Cost $78.050. The aldermen at their meeting, Jan. 30, referred the recommendation to the Committee on Water.

HARRISBURG, PA.—Two plans for the new market houses have been received by the committee on the market house, by D. R. Miller of Harrisburg, and Durang. These are for one story buildings for which the committee advertised. The committee have agreed to submit to councils; also a plan for a two story building by a Mr. Alricks. The Miller plan provides for two buildings 173 x 65 feet of stone and brick. Cost $31,000. The Durang building is estimated to cost $31,567.

ONEIDA, N, Y.—The subject of water works is being agitated again, a company will probably be organized which will ask the village to give them the exclusive right of furnishing water. They propose to locate a reservoir near Sand Hill.

DANVILLE, ILL.—We are informed by Mr. R. P. Corbyn, Engineer of Construction of the Danville Water Works, that contracts have been awarded as follows: Dennis Long & Co., of Louisville, Ky., furnish the pipe; Geo. F. Blake Mfg. Co., of New York, furnish and erect, complete, the pumping engines and boilers, and give the machinery, ready to start; J. M. Hankey, of Danville, puts up the pump house, and Rohan Bros., of St. Louis, the stand pipe, which is to be 40-inch diameter and 200 feet high. L. M. Brown, of Danville, is to lay the pipe, of which there will be about 13 miles, and the Ludlow Valve Co., of Troy, N. Y, furnish the valves.

COUNCIL BLUFFS, IA.—Reports state that the water works now being constructed by the Council Bluffs City Water Works Co., are rapidly approaching completion. A centrifugal pumping engine capable of pumping two and a half million gallons of water per *hour* is to be used to pump the water from the Missouri River into the two large settling reservoirs. From these reservoirs the water is to be pumped into a storage reservoir holding over three million gallons of water. All of the distributing mains—a little over sixteen miles in length—are already laid, and 152 fire hydrants are set in place complete.

CINCINNATI.—A number of Easton and Cincinnati capitalists are engineering a scheme to obtain from the State and city the bed of the canal that worms its way from the northwest to the southeast through the city. They propose to cut off the canal when it enters the city and take it due south along the mill creek bottom to the Ohio river. They propose farther to make of the vacated canal at the same time a boulevard and railroad tracts by running trains below the street grade and roofing over. There is no doubt that the stagnant water of the canal is a nuisance and unhealthful, for which its utility within the portion of the city it occupies is no equivalent. There are other designs upon it, however. It is wanted for a city help railroad by existing railroads, and there is a movement among citizens to devote it exclusively to the purpose of a boulevard.

FINDLAY, O.—The subject of water works is exciting earnest discussion.

MATTOON, ILL.—The Council have under discussion a proposition from Travers Daniels, of Clarksville, Tenn., to establish water works.

COLUMBUS, O.—The contract for furnishing material and constructing the Fulton street sewer has been awarded to John Creenane for $16,000. City Engineeer Graham reports on the Broad street brick sewer, 5 feet and 4½ feet inside diameter. He estimates the cost at $17,874. The Council, Jan. 29, passed a resolution requesting their representatives to press the bill in the State Legislature giving counsel the authority to issue sewer bonds to the amount of $200,000 for the sewer fund, to be expended on the sewers now under construction.

UNIONTOWN, PA.—An offer has been received from W. T. Kirhan, of Pittsburg, to construct water works at his own expense, provided the borough would pay $1,200 per year for 30 fire plugs.

Digitized by Google

CINCINNATI.—The Council, Feb. 2, passed a resolution to request the Legislature not to pass the bill authorizing the issue of $6,000,000 of water bonds for the removal of the water works to Markley Farm.

MIDLAND, MICH.—The water works are completed. The pumps have a capacity of 1,500,000 gallons daily; M. Walker, of Port Huron, contractor.

MONTREAL.—A tender for scavenging was received from Mr. Mann, the present contractor, for $14,000. The Health Committee of the Board of Aldermen regarded this as excessive, and have put the work under the supervision of three Aldermen for a month, until other arrangements can be made.

ROCHESTER.—Superintendent D. S. Almstead, of Mt. Hope reservoir, reports for January as follows: amount of water used in city was 155,939,100 gallons. The largest amount of water used during 24 hours was 6,373,600 gallons.

NEW YORK.—The lowest of the bids for a lot of iron pipe fittings, etc., opened on the 2d inst., at the office of the Department of Public Charities and Corrections was $644.12, by Sam'l W. Sears. His bid of $69.83 for 18 Simonds Manufacturing Co. hot air registers (15 inches), six barrels charcoal and ten pounds rosin, was also the lowest.

KINGS COUNTY, N. Y.—Proposals for a new iron turntable for the wooden bridge over Newtown Creek at Blissville were received by the joint Committee of the Boards of Supervisors of Kings and Queens Counties on Bridges, on Jan. 31, as follows: John D. Leary, $7, 344; Howell & Saxton, $3,587; the same, another pattern, $3,800. John H. O'Rourke offered to put in order the present disabled turntable and operate it three years for $3,500 a year.

PHILADELPHIA.—The committee on survey of council agreed to recommend to council the construction of the sewers on the following streets: On Clearfield street, from Germantown avenue to Sixth street; from Fifth street to Second street, at a cost of $50.000; Mayer street from Vienna street to Montgomery avenue; Oxford street from Ridge avenue to Twenty-first street; Nineteenth street from Ridge avenue to Girard avenue; on Montgomery avenue from Sixteenth to Seventeenth streets; Nicholas street from Twenty-fifth to Twenty-sixth streets; Ontario from Seventeenth to Eighteenth streets; Winter street from Fifteenth to Sixteenth streets; Jefferson street from Eighteenth and Bouvier streets; Tenth street from York to Dauphin streets; Verango street from Seventeenth and Twentieth streets.

At the same meeting the plans for the construction of the new Market street bridge over the Schuylkill river, were submitted by the Chief Engineer of the Survey Department. The bridge is to consist of three arches, the two end arches being each 117 feet, the centre one 123 feet; the bridge is to be constructed of stone, and is to be 100 feet broad.

The piers supporting the bridge will have to be built anew, the old ones not being serviceable. For the construction of this bridge the City Council have appropriated the sum of $300,000.

The plans for the contemplated sewer to carry the sewage from Manyunak to below the Fairmount Dam was also submitted. It is to be built along the east river bank and will not obstruct the Park drive. For this work Council some time ago appropriated $100,000.

Abstract of bids for granite for Deleware Breakwater Harbor, January 27, 1883:

Jas. M. Andrews, Biddeford, Me., $3.50 per ton (2,240 lbs.); Francis H. Smith, New York City, $3.23 per ton; John Beattie, Leetes' Island, Conn., $3.25 per ton; Mt. Waldo Granite Works, Frankfort, Me., $5.42 per ton; Ellsworth & East Blue Hill Granite Co., Ellsworth, Me., $5.97 per ton; Wm. H. Browne, Brooklyn, N. Y., $3,23 per ton; Leiper, Lewis & Ward, Chester, Pa., $4.23 per ton; George G. Leiper, Chester, Pa., $3.42 per ton; Conshohocken Stone Quarry Co., Philadelphia, $4.35 per ton. The award for the work has not yet been made, there being two whose bids are the same, $3.23.

CHICAGO.—The City Council, by order passed Jan. 30, directs the Commissioner of Public Works to "take the necessary steps" to cover the La Salle street tunnel for one-half a block, from Lake street southward. Bids will be invited; the roughly estimated cost is $30,000.

A bill has been reported in the Legislature of Massachusetts incorporating the Spencer Water Company. Capital $200,000.

BOSTON.—The annual report of James C. Tucker, Superintendent of Public Buildings, shows that $95,791, was expended last year on city buildings, except school houses and county buildings. Expenditures for ordinary repairs, supplies and furniture for the school houses amounted to $192,879, repairs to county buildings $41,716. The total valuation of county and public buildings and school houses including land and furniture is $18,883,300.

A contract was awarded to the Mt. Waldo Granite Works of Frankfort, Me., Feb. 1, for the sum of $945 for the granite coping for the approaches to the Custom House at Hartford, Conn.

The Cincinnati Board of Public Works has been notified by the attorneys of the "National Liquid Leak Detector Company" that the Bell "Waterphone" is an infringement on a patent owned by the company of an invention of W. W. Bostwick in 1879.

Among the contracts awarded by the Fire Commissioners of Philadelphia for supplies for the department were, for red brass castings at 21⅞ cents per pound, gun metal at 21⅞ cents per lb., bell metal at 28 cents per lb., anti-friction metal at 29 cents per lb., iron castings at 5 cents per lb., malleable iron castings at 15 cents per lb., boiler rivets, varying according to size, 8 to 10 cents, domes for engines at $85 each.

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

MISCELLANEOUS.

ALBANY, N. Y.—Hudson ave and Green st, Mercantile building in Holland Dutch style; o, Thos. Owens; a, F. H. Janes.

BRIDGEPORT, CONN.—A new factory to cost $65,000, by Messrs. Fletcher, Pinkham & Farrel. Ground donated by P. T. Barnum, N. T. Worden and others.

CLINTON, IOWA.—In Jackson Co., near Andrew, on County farm, br dwel, cost $8,000; o, Jackson Co.; a, W. W. Sanborn; b, Jacob Becker.

CHICAGO.—The majority report of committee on public buildings, jail and criminal court, recommending the adoption of Architect Egan's plans for improving jail and criminal court buildings, and the advertising for proposals, has been adopted by the county commissioners.

DENVER.—Champer st, add, to hotel, cost $2,000; o, S. Holtzman.... 235 Holliday st, br, stores, cost $13.00; o, W. H. Lyon....17 Lincoln ave, br dwel, cost $6,500; o, W. F. Tupper; a, L. Cutshan ....Curtiss st, alt Grand Army Hall, cost $9,242; o, J. B. Hatch; a, E. P. Brink.

DUCKVILLE, MASS.—The Boston Duck Co. will immediately rebuild the dye house and finishing department recently destroyed by fire.

FALL RIVER, MASS.—The Flint Mills will rebuild on site of old mill recently burnt; plans by Mr. Thompson, of Providence, R. I.

GLOVERSVILLE, N. Y.—Brick school house; cost $12,000; b, D. E Sutliff & Co., ventilated by "Ruttan" patent method.

KANSAS CITY, MO.—Lots 32, 33, and 34, block 12, Dundee Place, M. E. Church; cost $20,000.

MINNEAPOLIS.—West's hotel; cost over $1,200,000. Present contract is for $837,000, to be finished in June; of brick, marble masonry and iron. Thoroughly fire-proof. To contain 450 rooms; a, L. S. Buffington.

NEW YORK.—An addition to the Fifth Avenue Hotel, to be on 24th st, as far as the Madison Square Theatre; will be commenced in the spring; a, D. & J. Jardine.

NEW DURHAM, N. J.—The building to be erected here by the West Shore Railroad will cost $300,000. Andrew Bogert, of Englewood is drawing the plans.

NASHVILLE, TENN. The new colored school on South Summer street of brick, will seat 700 children; cost $12,000.

ONEIDA, N. Y.—W. R. Williams will be the architect and builder of the brick residence of Mr. A. R. Randall.

ROCKAWAY, L. I.—A syndicate represented by Gen. Francis C. Barlow has bought the large hotel, and it is understood will furnish it and open for business next summer.

STAMFORD, CONN.—A new Presbyterian church to cost $60,000, is to be built.

SOUTH WORCESTER, MASS.—Carpet mill, of br and wood; b, G. M. J. Whithall.

TROY, N. Y.—Third st, near Ferry, two b st dwel, cost $11,000; b, Edward Kelly....Second st. two br, dwel, cost 6,000 each; b, Edmund Broderick....Second st, b st dwel, cost $6,500; b, Jackson.

OUTSIDE POINTS.—Iowa City, Iowa, br and st medical college; cost $30,000; o, Iowa State University; a, J. C. Cochrane; b, Thomas & Hugh Colwell, of Ottawa, Ill.....Marshall, Saline Co., Mo., br and st court house; cost $56,000; o, the county; a, J.C.Cochrane; b, John Volk & Co., of Rock Island....Valparaiso, Ind, cut st and br court house; cost $100,000; o, Porter Co; a, J. C. Cochrane; contract not yet let....Atlantic, Iowa, st and br court house; cost $56,000; o, Cass Co.; a, J. C. Cochrane; b, O. J. King, of Corning, Iowa....Sycamore, Ill., Queen Anne house; cost $10,000; o, Con. Reuben Ellwood; a, G. D. Randall; b, by the day....Marinette, Wis. br house; cost $5,000; o, Prof. Anerswald; a, J. D. Randall; b, not decided....Marinette, Wis., br house; cost $5,000; o, Dr. M. A. Miller; a, G. D. Randall; b, by the day.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

For the week ending Jan. 27 in 34 United States cities, having an aggregate population of 6,995,681 there are reported 2,927 deaths, corresponding to an annual death rate of 21.8 per 1,000, a diminution from the rate of the two preceding weeks, which was 22.4 per 1,000, and less than in any of the groups of foreign cities.

In the North Atlantic cities the rate was 21.2; in the Eastern cities 23.3; in the lake cities 18.6; in the river cities 20.2 and in the Southern cities, for the whites, 19.1 and for the colored 34.0 per 1,000. The rate in the river cities is raised by the comparatively high rate in St. Louis, viz., 26.1

Deaths from small-pox are reported from Philadelphia, Wilmington, Chicago, Pittsburgh, Louisville, Minneapolis and Richmond. The number of deaths from acute lung diseases continues large. Diphtheria is especially prevalent in Philadelphia, Detroit and St. Louis.

NEW YORK CITY, LUNATIC ASYLUM, BLACKWELL'S ISLAND.—Dr. Franklin reports eight admissions, five discharges, four deaths and 1,315 insane patients remaining under treatment.

ATLANTA, GA.—Dr. Jas. B. Baird states that two of the three deaths from small-pox occurred in the hospital outside the city.

PLYMOUTH, MICH.—Dr. C. De Muth reports no deaths as having occurred during the three weeks ending Jan. 20. Population 3,000.

DETROIT, MICH.—Dr. O. W. Wight reports 31 cases of scarlet fever and 23 of diphtheria.

MILWAUKEE, WIS.—Dr. E. W. Diercks reports 16 cases of scarlet fever and six of diphtheria. The accidental deaths occasioned by the burning of the Newhall House have not been taken up on Dr. Diercks' mortality reports.

LOUISVILLE, KY.—Dr. E. R. Montgomery reports 13 new cases of small-pox; with one exception they were removed to hospital.

PROVIDENCE, R. I.—Dr. E. M. Snow reports a case of small-pox which came on steamer direct from Baltimore.

Digitized by Google

BOSTON, MASS.—C. E. Davis, Jr., reports 39 cases of diphtheria 21 of scarlet fever, three of typhoid fever and one of small-pox. On January 25, quarantine inspections of all vessels arriving from Baltimore were ordered.

ROCK ISLAND, ILL.—Dr. G. G. Craig reports only two deaths during the week, one under five years from whooping cough.

SANDWICH, ILL.—Dr. Nahum E. Ballou reports the presence of scarlet fever.

NEWBURYPORT, MASS.—Geo. H. Stevens, city clerk, reports 11 deaths. Two of the decedents were under five years of age. The average age of the nine others was about 62 years.

NEW YORK QUARANTINE.—A case of small-pox arrived from Europe on the Abyssinia on Jan. 14. It was reported as having been isolated on the day succeeding the appearance of the eruption. The passengers were examined at quarantine and 11 vaccinated in addition to those vaccinated by the steamer's surgeon. Dr. W. M. Smith reports that "There are gratifying evidences of an effort to secure re-vaccination among the emigrants before leaving their homes."

BALTIMORE, MD.—For the week ending Jan. 27 there were 252 deaths in this city; males 128, females 124; under five years 105, over 60 years 37. Small-pox caused 75 of the deaths, croup four, diphtheria 18, scarlet fever six, pneumonia 18, bronchitis two and consumption 29.

MICHIGAN.—Dr. Baker's statement gives the following diseases in their order of greatest area of prevalence during the week ending Jan. 20; rheumatism, neuralgia, bronchitis, consumption, tonsilits, intermittents, pneumonia and influenza. Scarlet fever was present at 21 places, diphtheria at 19 and measles at ten places. Small-pox was reported at Royalton, Berrien Co. (three cases), on Jan. 17. "Since the close of the week there has been a remarkably low temperature and a considerable increase in ozone. Judging from past experience we may predict a probable increase in influenza, which disease has sometimes preceded cerebro-spinal meningitis."

CALIFORNIA.—The Monthly Circular of the State Board of Health, for Dec. 1882, gives the mortality statistics of 22 cities and towns, aggregating a population of 402,511. The deaths numbered 678, corresponding to an annual rate of 20.16 per 1,000. Consumption caused 110, pneumonia 53, bronchitis 14, diarrhœal diseases 19, diphtheria 22, croup three, measles one, typhoid fever 40, malarial fevers 12 and cerebro-spinal fever two. No deaths are recorded from whooping-cough, scarlet fever or small-pox. "Although not strictly belonging to the month of December, but rather to the early part of the present month, January, 1883, it is proper to give timely notice of the occurrence of a few cases of small-pox at Red Bluff. Strict measures have been taken by the authorities, a supply of vaccine obtained, and there is thought to be but little danger of its extending. It is well, however, to be prepared for any emergency, and to urge upon the unprotected everywhere, a resort to the only prophylactic known to medical science."

ERIE, PA.—The Annual Report for 1882, of Dr. E. W. Germer, Health Officer, shows 499 deaths, males 259, females 240; under five years 184, over 60 years 80; estimated population 30,000 to 32,000. Death rate about 16 per 1,000. Causes of death: consumption 64, diarrhœa 44, diphtheria 31, convulsions 40, pneumonia 28, typhoid fever 20, malarial fever nine, puerperal fever eight, small-pox 12, croup nine, whooping-cough seven, erysipelas three. About 68 cases of small-pox were treated during the year. At one time it seemed as if the disease would assume epidemic proportions, but energetic measures prevailed against it.

Dr. Germer enters a plea for a tenement ordinance. "Unfortunately," he says, "in our city, a great many dwellings overfilled with people, are nothing but breeding places for all kinds of disease. Such people pay generally a big rent and are bound to stay by a tight lease. I had five cases of small-pox in one house, and as the landlord refused to procure city water, the people had to get their water from the neighbors, and thus expose them."

JACKSONVILLE, FLA.—Dr. A. W. Knight, sends the semi-annual return of mortality for the last six months of the year 1882. Population 10,000; whites 6,000, colored 4,000; total deaths 80, white 40, colored 40; under five years 34; annual rate, white 13.2, colored

(Continued on page 230.)

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

READERS WILL CONFER A FAVOR BY MENTIONING THE SANITARY ENGINEER WHEN THEY COMMUNICATE WITH ADVERTISERS.

MOLLER'S
NORWEGIAN
COD-LIVER OIL.

PUREST AND BEST.

FOR GENERAL DEBILITY, SCROFULA, RHEUMATISM OF CONSUMPTION, it is superior to any in delicacy of taste and smell, medicinal virtues and purity.

London, European and New York Physicians pronounce it the purest and best. Sold by Druggists.

W. H. SCHIEFFELIN & CO.,

Wholesale Agents for U. S. and Canada,

NEW YORK.

Pure Sugar
vs.
Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

HAVEMEYERS & ELDER.
DECASTRO & DONNER REFINING CO.

117 WALL STREET,
NEW YORK.

Reliable Food Products.

Great progress has been made, within a few years, in manufacturing food products, and the standard of quality has been raised to a point far beyond that which formerly obtained. We claim that this has, to a considerable extent, been due to our efforts. As the Largest Manufacturers and Dealers in the world in this line, we consider it to our interest to manufacture only PURE and WHOLESOME goods, and pack them in a tidy and attractive manner. *All goods bearing our name are guaranteed to be of superior quality, and dealers are authorized to refund the purchase price in any case where consumers have cause for dissatisfaction.* It is, therefore, to the interest of both dealers and consumers to use THURBERS' BRANDS.

H. K. & F. B. THURBER & CO.,

Importers, Manufacturers, and Dealers in all varieties of Food Products; New York, London, and Bordeaux.

NOTICE.

Our Canned Goods are put up with a special quality of tin, and most of them, being hermetically sealed while fresh at the sources of supply, preserve the fresh, natural flavors, and are REALLY FRESHER, MORE WHOLESOME AND PALATABLE than many so called "fresh" articles which are exposed for sale during considerable periods of time in city markets.

20.0. Accidents caused four deaths, consumption seven, diarrhœal diseases four, diphtheria three, typhoid fever three, malarial fevers eight, puerperal fever one, and pneumonia one. No deaths from scarlet fever, measles, whooping-cough, croup or small-pox.

ONTARIO, CANADA.—The Provincial Health Bulletin for the week ending Jan. 20 shows the prevailing diseases in the following order: neuralgia, bronchitis, rheumatism, influenza, anæmia, tonsilitis, pneumonia and consumption.

Varicella is reported from several widely separated districts and is regarded as premonitory of small-pox.

AUX CAYES, HAYTI.—Consular Agent Dutton reports the small-pox as disappearing. Only one death occurred from this disease during the two weeks ending Dec. 30.

HAVANA, CUBA.—Dr. D. W. Burgess reports two deaths from yellow fever during the week ending Jan. 19. There are ten cases under treatment in the city and in the military hospital.

ST. HELENA (ISLAND OF).—Consul Jas. A. McKnight reports under date of Dec. 31, that the island has been under quarantine since the middle of July last owing to small-pox at the Cape and on the African coast, but though vessels bearing the infection have anchored in the roads, no case of contagious disease has appeared on the island.

BUENOS AYRES, ARGENTINE REPUBLIC.—The monthly *Bulletin of Hygiene* for November shows the number of deaths to have been 508 in a population of 177,787. Deaths under five years 308; over 60 years 33. Small-pox caused 64 deaths.

ENGLAND.—The return of the Registrar General for the week ending Jan. 13, shows an average rate of 22.4 in the 28 principal towns Derby gave the lowest rate 9.1, and Liverpool the highest, 33.7. Small-pox caused seven deaths in London but not one in any of the 27 large provincial towns. A general summary of the returns is given in our statistical table.

In London 2,808 births and 1,567 deaths were registered. Allowing for increased population the former exceeded by 22, whereas the latter were 213 below the average numbers in the corresponding weeks of the last ten years. The deaths included seven from small-pox, 46 from measles, 31 from scarlet fever, 14 from diphtheria, 29 from whooping cough, 12 from typhoid fever, 12 from diarrhœal diseases; 32 new cases of small-pox were admitted into the hospital during the week, making 99 remaining under treatment. The deaths from diseases of the respiratory organs were 129 below the corrected weekly average.

SCOTLAND.—During the month of December there were registered in the eight principal towns the births of 3,444 children of whom 1,795 were males and 1,649 females. The deaths numbered 3,001; males 1,469, females 1,532. This number is 85 above the average for December during the last ten years, making due allowance for increase of population. Of the decedents 1,175 were under five years of age. Whooping cough was the most fatal epidemic, having caused 153 deaths, or 5.1 per cent. of the whole mortality. Fever caused 62 deaths of which 17 were tabulated as typhus. Scarlet fever caused 84 deaths, measles 53, croup 41, diarrhœa 40, diphtheria 29, consumption 257, or 8.6 per cent., and acute diseases of the respiratory system 864, or 28.8 per cent.

The return for the week ending Jan. 13 gives 26.8 as the rate in the eight principle towns. The lowest mortality was recorded in Leith, 17.6, and the highest in Greenock, 34.2 per thousand. In Edinburgh the rate was 17.8. No deaths from small-pox were registered.

IRELAND.—Consul A. B. Wood, of Belfast, transmits the return of the registrar general for the week ending Jan. 13. In Dublin the rate was 29.3, and in Belfast 30.1. For summary see table given above.

PARIS, FRANCE.—During the week ending Jan. 11 there were 1,122 deaths, corresponding to an annual rate of 26.03. Of these 610 were males and 512 females; 310 under five years, and 234 over 60 years. Typhoid fever caused 69 deaths, and small-pox six, measles 28, scarlet fever none, whooping cough two, croup and diphtheria 42, dysentery two, erysipelas 11, puerperal fever three, consumption 208, acute bronchitis 42, pneumonia 69, and violence 47 deaths. On Jan. 7 there were 78 csses of small-pox, 672 of typhoid fever, and 30 of diphtheria under treatment in the hospitals. The number of new cases of typhoid fever has diminished considerably. For the first time in five months it has fallen below 100. Measles, on the contrary, are increasing. The deaths from this cause during the week have been as numerous as in July, 1882, when the disease was considered epidemic. The births during the week numbered 1,365.

RHEIMO, FRANCE.—During the week ending Jan. 6 there were 49 births and 56 deaths in a population of 93,823. Typhoid fever caused seven deaths, bronchitis six, pneumonia seven, pleurisy seven, consumption eight, and diphtheria two. No deaths were reported as caused by measles, scarlet fever, whooping cough or small-pox.

BORDEAUX, FRANCE.—Consul Geo. W. Roosevelt transmits the monthly bulletin for Dec. 1882, showing the occurrence of 454 deaths in a population of 221,308. No deaths are recorded from small-pox or scarlet fever. Measles caused one death, typhoid fever 17, croup six, whooping cough two, puerperal fever seven, dysentery four, bronchitis 11, pulmonary catarrh 23, pneumonia and pleurisy 38, consumption 69, and violence 14; 94 of the deaths occurred in persons over 70 years of age. Mr. Roosevelt reports the city as in good sanitary condition.

STOCKHOLM, SWEDEN.—Consul Elpwing reports 108 deaths for the week ending Dec. 30. Males 60, females 48; under five years, males 20, females 19, total 39; over 60 years, males 8, females 8, total 16. Annual rate per 1,000, 32.1. Measles caused three deaths, scarlet fever five, whooping cough three, diphtheria four, bronchitis seven, pneumonia 21, consumption 14, diarrhœa six, and accidents three deaths.

ROTTERDAM, NETHERLANDS.—Consul Jno. F. Winter reports 16 cases of small-pox, two of which were fatal, during the week ending Jan. 6.

BRUSSELS, BELGIUM.—During the week ending Jan. 6 there were 261 births and 175 deaths in the city and its suburbs, corresponding to annual rates of 33.8 and 22.6, respectively. 62 of the decedents were under five years of age. Small-pox caused two deaths, measles one, scarlet fever none, typhoid fever three, diphtheria one, croup none, whooping cough two, diarrhœal diseases 14, bronchitis and pneumonia 26, and consumption 33.

COPENHAGEN, DENMARK.—During the week ending Dec. 26, there were 99 deaths; under five years, 43; over 60 years, 24. Scarlet fever caused two deaths, diphtheria one, whooping cough two, typhoid fever two, diarrhœal diseases three, puerperal fever two, erysipelas one, consumption 14, pneumonia seven, bronchitis 11. Cases of epidemic diseases were reported as follow: Measles seven, scarlet fever 34, diphtheria 10, whooping cough 34, typhoid fever three, diarrhœa 81, erysipelas 26, puerperal fever three, bronchial catarrh 308, pneumonia 65, tonsilitis 100.

During the week ending Jan. 2 there were 153 deaths; under five years, 76; over 60 years, 29. Measles, scarlet fever, diphtheria, and croup each caused two deaths; whooping cough four, diarrhœa six, pneumonia 12, bronchitis nine, consumption 17. Cases were reported as follows: Measles nine, scarlet fever 28, diphtheria 13, whooping cough 44, typhoid fever two, diarrhœa 89, erysipelas 22, puerperal fever two, bronchial catarrh 363, pneumonia 43, and tonsilitis 123.

VIENNA, AUSTRIA.—Consul General Weaver reports 381 deaths during the week ending Jan. 6, in a population of 749,762, which is equal to an annual rate of 26.4 per 1,000. Consumption caused 91 deaths, acute lung diseases 68, small-pox four, and scarlet fever, diphtheria, and whooping cough three deaths each.

WARSAW, RUSSIAN POLAND.—Consul Rawicz sends reports for the weeks ending Dec. 23 and 30, showing, respectively, 264 and 218 deaths in a population of 383,973. Small-pox caused five deaths during the two weeks.

BOMBAY, INDIA.—Consul B. F. Farnham sends reports for the three weeks ending December 12, 19 and 26:

December 12. Deaths 416, or 58 less than the mean of the corresponding period in the past five years. Annual rate 25.89. There were 69 deaths from remittent fever, 66 from diseases of the respiratory system, 19 from diarrhœa and seven from dysentery.

December 19. Deaths 422, or 51 less than the mean of the corresponding week in the previous five years. Annual rate 26.29. Remittents caused 72 deaths, diseases of the respiratory system 67, diarrhœa 22, and dysentery 15.

December 26. Deaths 397, or 94 less than during the week ending December 27, 1881, and 83 less than the mean of the corresponding week of the past five years. Annual rate 25.01. Deaths from remittent fever 63, from diseases of respiratory system 64, from diarrhœa 16, and from dysentery 13.

SINGAPORE, INDIA.—Consul A. G. Studer transmits the report of the Registar General for November. 380 deaths took place of which five only are recorded as having occurred among Europeans. Fever caused 98 deaths, convulsions 33, diarrhœa 27, consumption 60, dysentery seven, beri-beri six, leprosy six and small-pox five.

BRISBANE, NEW SOUTH WALES.—During the month of October, 111 births were registered, males 59, females 52, and 99 deaths, 51 males, 48 females, in a population of 33,068. Of the decedents 57 were under five years, or 57.58 of the total mortality. Zymotic diseases caused 40 of the deaths.

MELBOURNE, AUSTRALIA.—In the city and suburbs, embracing a radius of ten miles and a population of 284,874, there were in October 759 births, males 396, females 363, and 397 deaths, males 241, females 156, the excess of births over deaths being 362. To every 1,000 of the population of the district the proportion of births registered was 2.66 and of deaths 1.39 for the month. The deaths of 20 persons of the age of 75 years or upwards were recorded during the month. The deaths under five years numbered 124, males 82, females 42. Scarlet fever caused two of the deaths, diphtheria one, croup one, typhoid fever 11, diarrhœa and dysentery nine, consumption 49, bronchitis 25, pleurisy five, pneumonia 26, congestion of lungs ten, and violence 26. The zymotic death-rate was low during the month.

TYPHUS FEVER IN THIS CITY.

The following is a brief history, up to Saturday of last week, of the recent cases of typhus fever in this city.

The first was that of a girl about thirteen years old, living in the rear house at No. 169 Hester street. It is a filthy tenement house, and the disease is believed to have originated there. The girl was taken sick Dec. 9, and seven days later (Dec. 16) was taken by friends into the front house at the same number. She had no physician, and was convalescent on the 15th day.

The second case was that of one of the young women who took care of the first case after she was moved into the front house. She was taken December 26, and died at the house on the 14th day.

Digitized by Google

The third was a young woman, sister of the first, who was taken sick December 28; was sent to Bellevue Hospital, as a typhoid case, January 8, to the Reception Hospital, January 11, and to Riverside (contagious diseases) Hospital, January 13. She was convalescent on the 16th day.

The fourth, a girl, and sister of the second, who assisted in the care of the first, was taken Dec. 28, the same day as the preceding. She was removed, January 10, to Bellevue, and to Riverside, Jan. 13; was convalescent on the 23d day.

The fifth was a girl, a sister of the first and fourth, living in the same house. She was taken January 2, and removed direct to Riverside January 8, and was convalescent on the 14th day.

The sixth was a young woman, attendant at Bellevue, who nursed one of the typhus patients there as a case of typhoid. She was taken Jan. 21, and transferred to Riverside, January 27.

The eighth and last case (up to the 3d inst.), was another young woman, attendant at Bellevue, who was taken soon after the last and removed to Riverside.

The ward in Bellevue where the typhus patient was while there, is under quarantine, no new patients being admitted, and a special isolation-room provided for suspected new cases developing there. The tenement house and the factory where the first case worked, is kept under constant watch, and it is hoped the disease will gain no further advance.

Charles E. Fowler, City Engineer of New Haven, Ct., died Jan. 28, of erysipelas, in the 41st year of his age.

The Hon. Ezra Parmenter, M.D., of Cambridge, a member of the State Board of Health, Lunacy and Charity, of Massachusetts, and the representative of Cambridge on the bridge commission, died at his residence, No. 37 Second street, East Cambridge, Jan. 30, in the 59th year of his age. When the Board of Health, Lunacy and Charity was established in 1879, Governor Talbot appointed Dr. Parmenter as one of the members, and on the expiration of his term last year he was reappointed by Governor Long.

Health Commissioner DeWolf, of Chicago, calls attention to the fact that children working in factories have no fit place to eat their luncheon in, but have to go down into the basements under the sidewalks near the water closets.

Col. Emmons Clark, Secretary of the New York City Board of Health, has sent, in a letter to Hon. D. B. Hill, President of the Senate, the resolutions of the Board of Health objecting to the bill for preventing the manufacture of cigars in tenement houses. The Board states that the health of the tenement house population is not jeopardized by the manufacture of cigars; that the bill is not a sanitary measure, and that it has never been approved by this Board.

A case is reported from Cleveland, O., where the coloring matter of a black stocking got into a wound, made by chafing, and caused serious poisoning of foot and leg.

In a lecture before the Franklin Institute the 22nd ult., Mr. C. H. Roney, C. E., showed the evil results of making use of the old rain water culverts to carry off the sewage, and the remedies suggested were illustrated by a number of designs. Tables showing the comparative death-rate of the principal cities of the world were exhibited, the influence of defective sewerage arrangements upon the death-rate was dilated upon, and the best mode of remedying the present defective systems described.

An ancient aqueduct has been discovered at Posilippo, during the excavation of a tramway tunnel. It is sufficiently lofty for persons to stand upright and walk along it. The walls are lined with thick cement, and they contain inscriptions concerning the villas supplied with water. One of the inscriptions records a partial restoration of the aqueduct.—*London Architect.*

INTERNATIONAL MEDICAL CONGRESS.

The Secretary-General of the International Medical Congress announces that the eighth session of that body will be held in Copenhagen the 10th to the 16th of August, 1884.

A MUNICIPAL MUSEUM OF HYGIENE AT PARIS.

"At a recent meeting of the Municipal Council of Paris, M. M. Bourneville, Cernesson and Loisean, made the proposition that, as the objects shown by the city of Paris, at the recent Hygienic exhibition at Geneva, excited in all the visitors to that meeting considerable interest, and aroused their attention, it is desirable that these sanitary objects should be exhibited in the pavilion belonging to the city of Paris, in the Champs Elysées; that they should be completed by the addition of plans of schools, hospitals, baths, hydrotherapeutic appliances, etc., recently agreed on by the Municipal Council; and that the municipal authorities should seek for a permanent receptacle to contain the different objects, so as to create a municipal museum of hygiene.

"It is probable that, if the Parisians were not at the present time much taken up with that special form of socialism, which thinks to solve every economic problem by the heroic and wide-spread application of nitro-glycerine and dynamite, they would take up these propositions with the warmth they deserve. The sanitary questions, to which the propositions of M. Bourneville and his colleagues refer, are of considerable importance to the welfare of the masses, and are a direct outcome of that science of hygiene which has been so well defined by Paul Bert, as "social morality" (*la moralité des societés*). The utility of such an organization for Paris is incontestable, especially if it were followed up by public health legislation, more or less on the English, German and Swiss lines. It would then be easy to pass the law for the improvement of unhealthy dwellings drafted by M. Martin Nadand; and that for the sanitary inspection of factories which is under the charge of M. M. Nadand and F. Faure. Great services would also be rendered to Paris by the creation of a central sanitary authority, kept well informed on sanitary matters by subsidiary health committees, such as already exist at Brussels and Turin, and in France itself, at Nancy, Rheims and Havre. The true value of such a system would be brought home to the great body of the Parisians, by the establishment of the museum desired by the gentlemen whom we have already designated, similar in design to our Parkes Museum, and the proposed sanitary museum at Washington, United States of America."—*British Medical Jonrnal.*

The publisher of THE SANITARY ENGINEER will esteem it a favor if names of persons likely to be interested in the journal are sent to him, in order that he may send them specimen copies.

JOHN TRAGESER
STEAM COPPER WORKS,
Established 1850.
447 to 455 W. 26th St. —New York.— 273 Pearl Street.
Manufacturers of Copperwork for Plumbers, Distillers, Sugar Houses, Chemical Works, Essential Oils.
GALVANIZED IRON BOILERS, A SPECIALTY.
ALL SIZES CONSTANTLY ON HAND.

AMERICAN PHOTO-ENGRAVING CO.,

Sewers and Drains

FOR

Populous Districts;

With Rules and Formulæ for the Determination of their Dimensions under all Circumstances.

BY JULIUS W. ADAMS,

Chief-Engineer to the Board of City Works, and Consulting Engineer to the Board of Health, Brooklyn.

Illustrated with a Colored Map and numerous Engravings.
Octavo; 228 pages. Price, $2.50

This is a well printed octavo, from the pen of one of the best authorities of our day, and is well worthy of a place in the library of every city engineer and Board of Health in the community. The large experience of Mr. Adams as Chief-Engineer of the City of Brooklyn during the development of her elaborate system of water supply and sewerage has enabled him to present in a compact and terse manner all the leading facts and considerations which govern the construction of Sewers in most of our cities.

D. VAN NOSTRAND, Publisher,
23 Murray and 27 Warren Streets, New York.

*** Copies sent by Mail on receipt of price.

"American Sanitary Engineering."

Proposals.

PROPOSALS FOR BUILDING A STEAM PROPELLER FOR THE QUARTERMASTER'S DEPARTMENT.

DEPOT QUARTERMASTER'S OFFICE,
CORNER HOUSTON AND GREENE STS.,
NEW YORK CITY, *Feb.* 5, 1883.

Sealed proposals, in triplicate, with a copy of this advertisement attached to each, are invited, and will be received at this office until 12 M., March 7, 1883, at which time they will be opened in the presence of bidders, for the construction of a steam propeller for the United States Quartermaster's Department, for service at Fort Monroe, Virginia. Bids are invited to be made for the vessel complete; also for that portion embraced in specifications No. 1, or that in No. 2, or that in No. 3, only, or those portions in any two of them. Plans and specifications of the same, together with all other necessary information, will be furnished to bidders on application to the Chief Quartermaster on Governor's Island, New York Harbor, the Depot Quartermasters at Washington, Baltimore, Philadelphia and Boston, the Post Quartermaster at Fort Monroe, Virginia, and at this office. Bids are also invited for the work on the basis of supplying out-board, condenser, 6-inch, No. 8 copper, or ¼ brass. Also on the basis of the Government supplying the circulating and air pump, and a condenser of one-half the required capacity, the contractor furnishing the other half and making all connections. In either case, if award is made thereon, the specifications will be changed accordingly. The right is reserved, on the part of the United States, to reject any or all bids. Proposals should be endorsed "Proposals for Construction of Steam Propeller," and addressed to the undersigned.

HENRY C. HODGES,
Deputy Quartermaster-General, United States Army.

PROPOSALS FOR HARDWARE.

OFFICE OF SUPERVISING ARCHITECT,
TREASURY DEPARTMENT
WASHINGTON, D. C., *Feb.* 5, 1883.

Sealed prorosals will be received at this office until 12 M. on the 26th day of February, 1883, for furnishing and delivering at the Treasury Building, Washington, D. C. all the hardware required for the Court House and Post Office at *Philadelphia Pa.*, in accordance with specification and schedule, copies of which and any additional information may be had on application at this office or the office of the Superintendent.

JAS. G. HILL, *Supervising Architect*

Office of THE WINFIELD WATER WORKS COMPANY, WINFIELD, KANSAS.

Proposals for constructing Water Works will be received by J. L. Horning, Sec'y. Proposals will be received for the Reservoir System.

All communication must be addressed to

J. L. HORNING, Sec'y.

Furnishing 300,000 tons (2,240 pounds) of best gas making coal Until Feb. 15. Address WILLIAM R. PARK, *Chief Engineer of Philadelphia Gas Works*, 20 S. 7th street, Phlidelphia, Pa.

Dredging Saginaw River. Until Feb. 14. Address F. U. FARQUHAR, *Maj. Engrs. U.S.A.*, U.S. Engineer Office, Detroit, Mich.

Constructing an iron, truss or suspension bridge or covered wooden highway bridge over the Youghiogheny River. Until March 1. Address the McKEESPORT & YOUGHIOGHENY BRIDGE CO., McKeesport, Pa.

Constructing low truss wrought iron highway bridge over the Grand River. Until Feb. 10. Address A. C. SEKELL, *City Surveyor*, Grand Rapids, Mich.

Constructing Buffalo trunk sewer, length about 24,000 feet, diameter for principal part of the length, eight feet; estimated quantity of brick 20,000,000. Until Feb. 20. Address D. C. BEARD, *Chairman of Board of Sewer Commissioners*, City Hall, Buffalo, N. Y.

Erecting two brick buildings for asylum near Milledgeville, Ga. Until March 1. Address JOHN HAMMOND, *State Lunatic Asylum*, Milledgeville, Ga.

Labor and material for erecting marine hospital building at Memphis. Until Feb. 15. Address JAS. G. HILL, *Supervising Architect*, Treasury Department, Washington, D. C.

Furnishing 25,000 pounds of half-inch iron chains. Until Feb. 16. Address MAJ. W. E. MERRILL, *U. S. Engineers*, U. S. Engineer Office, 82 west 3d street, Cincinnati, Ohio.

Finishing two sectional or water tube boilers; 900 superficial feet heating surface each. Complete, with cast iron fronts, guages, check, blow off, safety valves, etc. Until February 13. Address, A. HICKENLOOPER, *President* Cincinnati Gas Light and Coke Company. Fourth and Plum streets, Cincinnati, O.

Constructing piers for iron swing bridge at South Norwalk, Ct. Until Feb. 14. Address, W. A. Earle, *Chairmna of Bridge Committee*, South Norwalk, Ct.

Rebuilding with iron hull, Revenue Steamer "Perry." Until Feb. 17. Address, CHARLES J. FOLGER, *Secretary of the United States Treasury*, Washington, D.C.

Building two-story brick school-house. Until Feb. 20. Address, BUILDING COMMITTEE, Brattleboro, Vt.

Furnishing materials and labor for constructing water works. Until Feb. 15. Address, MAYOR OF COMMON COUNCIL, Gloucester City, N. J.

The "National" Patent Side Outlet Closet and Trap.

WITH IMPROVED FLUSH. (Registered).

Made either complete in one piece of Earthenware, or in two pieces with Basin and Trap separate.

An important alteration has been made in the *flushing* arrangement of this closet. The *supply* is now placed *opposite* the *outlet*, and a *new registered fan* attached which makes the closet more effective, and with less than two gallons of water it is guaranteed to perfectly flush out the soil and thoroughly wash the inside of basin.

The Most Cleanly, Durable, Effective and Cheapest Closet and Trap ever used, requires no fittings nor Machinery of any kind, and cannot get out of order.

For the perfect working of this closet a supply pipe not less than 1¼ inch must be used.

MANUFACTURED BY THOS. TWYFORD, HANLEY, STAFFORDSHIRE, ENG.

Sole Agent for the Manufacturer, E. ASPINALL, 206 Pearl Street, New York.

RECENTLY PUT INTO THE **WHITE HOUSE** BY THE U. S. GOVERNMENT.

F. E. CUDELL'S

PATENT SEWER GAS AND BACKWATER TRAP

FOR

Wash Bowls, Sinks, Bath and Wash Tubs, Safe Wastes, &c.

204 *Superior Street*,

CLEVELAND, O.

This Trap is made of lead, except Dome Screw Cover and Ball, which are of hard metal.

The correct and disinterested conclusions from the tests lately made on Syphonage, for the National Board of Health proves this GRAVITY BALL **S** TRAP to be the only reliable safeguard against sewer gas.

Twenty-six thousand of them in use, giving full satisfaction to prominent Sanitary Engineers, Architects and Plumbers.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

B. P. BOWER & CO., Manufacturers, Cleveland, O.

Every Subscriber should have one of our neat BINDERS to preserve the copies of THE SANITARY ENGINEER for future reference. Price, $1.00. Postage paid.

Salt-Glazed, Thoroughly Vitrified

Sewer and Drain Pipe,

BENNOR SYPHON TRAP

Will recommend itself to

ARCHITECTS, PLUMBERS AND SANITARY ENGINEERS,

Because: *First*—It is a perfect seal under all circumstances, with or without water.

Second—By the peculiar construction of the valve in connection with its syphoning force the trap and adjoining pipes are kept clean and free of coating.

Third—It cannot become clogged.

Fourth—It is simple, durable, cheap and easily adjusted.

Bennor Syphon Trap Co., Limited,

17 North 9th St., Philadelphia, Pa.

TWO years ago the undersigned introduced to the trade in this country THE ROYAL PORCELAIN BATH.

Prior to that period it was little known, except to those Americans who may have seen them when traveling in Great Britain; while it is true that they had been used there for 25 years, and were universally conceded to be the finest thing in the way of a Bath Tub known, yet, like all things supposed to be new and of high cost, they required extensive advertising to secure their acceptance and use to any considerable extent in the United States.

The effect of numerous expressions of opinion, made without either knowledge or experience to justify them as to their durability and utility, had to be counteracted, yet, as a result, we have succeeded in having them selected for some of the most elegant residences that have been erected within the past ten years. They have also been used in several hospitals, for which places we make a special, less elaborate, and cheaper class of fittings.

A personal inspection will convince any one of their superiority. Their increased cost over that of an ordinary copper-lined bath tub should not be a consideration to those who can afford to live in a house worth over $15,000, and would not be if their cleanliness, inviting appearance and durability was appreciated.

MEYER, SNIFFEN & CO.

46 & 48 Cliff Street,
New York.

N. B.—We have imported a line of sinks, which are made of the same non-absorbent material as the ROYAL PORCELAIN BATH TUBS. They are admirable for Hospitals. They have been used in some of our elegant New York residences, where their expense was no objection. They are one and one-half inches thick, and are less likely to be broken than cast iron. We have a size in stock that would make an admirable "Foot Bath."

JENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

BARSTOW'S

Royal Garland AND Idlewild Square Base-Burners.

These stoves are made to meet the demand for Self-Feeding Base-Burners more in harmony with the prevailing tastes in house decoration. Of stoves representing their class, none have excited more favorable comment, and enjoyed a larger share of popularity, for the short time they have been before the public, than the ROYAL GARLAND and the IDLEWILD. They have many important features peculiar to themselves, that commend them over all others.

THE BRIGHTON.

There is a tendency in some quarters to demand a Hopper form of Water Closet and to dispense with what are called mechanical parts. This would be desirable, if the so-called mechanical parts did not secure advantages in the matter of a large body of water in the bowl, not otherwise obtainable, without resorting to methods not everywhere applicable or sufficiently demonstrated as practicable.

The Brighton Closet here illustrated is, we believe, the best compromise yet devised between the Hellyer form on the one hand and the Hopper on the other.

By examining the sectional cut, it will be seen that the bottom of the bowl is covered with water, while the flush and shape of the bowl is such that the trunk on the back is kept clean.

It is attractive in appearance, being all in one piece, of white earthenware.

The pipe *B*, connected with the trunk, can be run into a heated flue when desired.

These Closets have had a large sale in England during the past four years. We have had them in use in our factory nearly two years—and we now offer them to those who prefer a different form of Water Closet than the *Hellyer, which, by the way, does not, in a single instance, so far as we know, fail to satisfy those who have them in use.*

This will be known as

"Meyer, Sniffen & Co.'s Water Closet Apparatus No. 30."

Persons interested are invited to call at our warerooms, Nos. 46 and 48 Cliff Street, New York, or at No. 1 Pemberton Square, Boston, and examine this and other specialties that we have fitted up with water attached, including THE ROYAL PORCELAIN BATH, THE MODEL PORCELAIN SLOP HOPPER, THE HELLYER CLOSET AND HOPPER, THE RHOADS HOPPER, DOHERTY SELF-CLOSING COCKS, FULLER FAUCETS, etc.

DEMAREST'S
PATENT CISTERN CLOSETS,

MANUFACTURED BY

THE J. L. MOTT IRON WORKS,

Nos. 88 and 90 Beekman Street, New York.

THE "HYGEIA"

SIDE-OUTLET CISTERN CLOSET.

We take great pleasure in calling the attention of our customers, and all interested in sanitary matters, to the "Hygeia." For perfect cleanliness and simplicity of construction, we invite comparison with any Cistern Closet ever made, either of home or foreign manufacture. In short, we think, as do also those of our customers who have used this Closet in all their fine work for the past year, that it is, *par excellence*, ahead of anything yet made in the way of a Water Closet.

THE "ACME"

DIRECT-OUTLET CISTERN CLOSET.

To those who have a preference for a Direct-Outlet Closet we offer the "ACME" as being strictly first-class in every respect; it has been extensively used during the last three years in fine work in both public and private buildings, and has in all cases given the very best satisfaction. One important feature in this Closet is the outlet, which is full four inches, while most Closets of this class made hitherto are not over three inches.

COMPLETE ILLUSTRATED CIRCULARS SENT ON APPLICATION, WITH PRICES.

ALL OUR SANITARY SPECIALTIES ARE FITTED UP WITH WATER ATTACHED,

And may be seen at our Warerooms, Nos. 88 and 90 Beekman Street.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

British Subscribers who wish to receive this paper, without interruption should renew their subscriptions a month before expiration, with Messrs. E. & F. N. Spon, London, in order that they may be able to notify the Publisher, in New York, of the fact.

NOTICE.—Correspondents will prevent needless delays and annoyance if they will address all communications, except those of a strictly private nature, to THE SANITARY ENGINEER. Checks should also be drawn to the same order.

MEMPHIS AND SEWER GAS.

On the 24th of January last the New York *Times* contained an editorial taking the ground that the large mortality in Memphis is due to the sewers, and that while these sewers have been well built, under skilled supervision, and connected with the most approved house appliances, their introduction has been followed by an apparently consequent increase of the ratio of mortality, and in particular that the deaths from dysentery have doubled and those from diphtheria have more than quadrupled. The writer concludes:

"It would really seem as if they are right who contend that no ingenuity of trap, valve, or ventilation, no matter how carefully executed in every detail, can prevent the percolation of noxious gases into a dwelling house that is directly connected with sewage mains. It is an assured fact that since the attention of sanitary engineers has been especially directed to this subject in this city (New York), tracing back the agitation for the last three years, there has been a steady increase in the annual ratio of mortality. There have been no great epidemics to account for this fact, tenement and apartment houses have been steadily improving in sanitary provisions, the streets have been kept cleaner than before, our recent structures have comprised all the requisites of good plumbing and good engineering, and yet, as in Memphis, dysentery and diphtheria have obstinately persisted in strengthening their hold. Until the present system of direct connection (of our sleeping rooms with the sewage mains) was adopted, diphtheria was infrequent and dysentery a rare disease, and it is fair to infer that their recent prevalence is in some manner due to the latter mode of building."

The publication in a leading New York daily of an editorial based so largely on erroneous information and a vivid imagination as this is, is unfortunate. In this particular case the high character of the journal in which these statements appeared secured for them a recognition they did not deserve, and in several instances within our knowledge they have been quoted and used as arguments against the adoption of a sewerage system in communities where this question was under consideration. The author of this paper evidently could not have seen any of the annual mortality statistics of Memphis; he did not know whether diphtheria prevailed there or not; he did not know who supervised the construction of the sewers, but he proceeded, out of the depths of his inner consciousness, to inform the public on all these points.

The majority of our readers are, no doubt, somewhat familiar with the facts about the Memphis sewerage, that the first part of it was constructed under the supervision of Col. Waring, Major Benyaurd having had nothing to do with it, and that the high mortality of Memphis is due to impure water, damp cellars and basements, and to the peculiarities of its negro population.

The following figures are furnished by Dr. Thornton, the Health Officer of Memphis:

AN ANALYSIS OF THE MORTALITY RECORDS OF THE HEALTH OFFICE OF MEMPHIS.

DISEASES.	1875	1876	1877	1878	1879	1880	1881	1882
Malarial fevers	127	99	121	126	68	19	22	17
Typhoid fevers	19	8	14	10	7	17	17	11
Typho-malarial fevers	4	29	27	9	11	22	28	30
Erysipelas	6	1	6	1	12	3	9	5
Dysentery	66	79	63	30	25	45	77	11
Diarrhœa	30	67	61	46	36	49	68	41
Cholera infantum	52	21	31	19	32	11	19	19
Scarlet fever	1	49	17	1	..	13	2	..
Diphtheria	5	8	13	11	1	5	37	9
Croup	13	4	5	6	11	7	11	6
Pneumonia	88	87	108	83	136	89	79	53
Consumption	172	159	180	176	143	155	171	153
All other diseases of lungs	18	25	28	29	26	15	26	34

It is very evident from the above table that there has been no increase in the mortality rate in Memphis which can be charged to the sewerage. The sewers were constructed in 1880-81, and when we consider the increase in population occurring during these eight years, the mortality from the principal zymotic diseases has not increased. There was an epidemic of diphtheria in 1881, but that this was not due to the sewers is shown by the fact that in 1882 the mortality from this cause was less than it was in 1877 or 1878.

The causes of the high mortality in Memphis have been shown by Dr. Thornton to be connected chiefly with the negro population, and his paper on this subject will be found in THE SANITARY ENGINEER for November 16, 1882, p. 516.

NEW YORK'S WATER SUPPLY.

No. IV.

THE SUPPRESSION OF WASTE.

In 1875 Mr. Gale, the Water Engineer of Glasgow, stated that in that city, as the result of many years inspection, he found one tap wasting water for every eight taps examined. As the average number of taps in a house was three, he held that every third house was wasting water. Following this line of reasoning, about every house in this city is wasting water, more or less, during the twenty-four hours, since, instead of three taps per house, in New York the average is not less than twelve.

He very strongly urged the improvement of defective fittings, and after admitting the advantages of district meters and appliances for indicating where waste was going on, he yet held that the removal of imperfect fittings was the

Digitized by Google

only possible solution of this difficult question, and "he did not anticipate any improvement in this direction until the authorities instituted a system of testing and stamping of every fitting before it was allowed to be used, which had been so long successfully carried out in Manchester." It will be remembered this was stated prior to the enforcement of the rules which secured the gratifying results reported in our last article. In referring thus at length to Glasgow, we do so because our condition now is much the same as theirs was in 1875, and the remarks of Mr. Gale apply with special force to us today, especially when he says, "in Glasgow, the water fittings were very numerous, and as the great bulk of the house property had been put up by speculative builders, they were, as a rule, neither sufficiently strong nor properly finished." How absolutely true this statement is, if applied to this city, every plumber and dealer in plumbers' supplies knows.

The rules governing the class of fittings allowed, and the methods of doing the plumbing work, were printed at length in THE SANITARY ENGINEER of May 25, 1882, page 538; the leading features of which, not in force in this city are the following:

A stop-cock on the supply from street main to house.

Definite rules to govern the construction of cisterns with reference to the manner of attaching the ball cock.

The location of cisterns, the location of the overflow-pipe in a cistern with reference to the water line when ball-cock is closed, also the terminus of the overflow-pipe.

No fitting or appliance is allowed to be used that does not bear the maker's name and conform to a standard set by the chief engineer, and is not able to stand the tests to which it is subjected by the testing officers.

Ground key bibbs, or taps, are not allowed on pipes direct from the main.

No water closet can be supplied direct from the main, nor from a tap of any kind. Every water closet must be supplied from a special cistern so constructed as not to be capable of discharging more than a given amount of water at each flush, and so that it cannot be made to flow continuously, either by intention or neglect.

These latter rules, with regard to flushing of water closets, if strictly enforced in this city, would, in our judgment, save at least ten millions gallons daily. This estimate is justified by the results obtained by the water authorities of Boston in some tests made by them and reported on page 500, issue of May 11, 1882, of this journal. It is true that about a year since the Department of Public Works made a move to attack this abuse by revising the water rates, and with a view to discourage the use of these objectionable fixtures they increased the tax on them. We are informed, however, that thus far it is not enforced, and what bid fair to produce some good results and make a beginning must apparently rest in abeyance until Commissioner Thompson can find the time to realize that, aside from the necessity of building a new aqueduct, his duty is not performed until he resolutely, and without fear or favor, attacks this question of the suppression of waste.

The clause of the Act under which the Glasgow rules are enforced is as follows:

"*Sec.* 17. All the apparatus used or to be used for conveying water to the houses of the inhabitants and manufactories, or other premises supplied or to be supplied with water under the provisions of the recited Act, shall be subject to the approval of the Engineer to the Commissioners: and in case of dispute between the parties providing such apparatus and such Engineer, such dispute shall be determined by the Water Committee of the Commissioners, whose decision shall be final.

[TO BE CONTINUED.]

We print elsewhere a notice that the New York State Board of Health propose to hold a special meeting in this city, February 24, to enable manufacturers of food products to confer with the Board on the question of establishing standards and declaring exemptions under the food adulteration act. The holding of this special meeting in New York is evidence that the Board are anxious to do all they can to draw out the views of those interested in this question, and to so exercise the discretion that is vested in them as to cause no needless interference with honest trade. If manufacturers fail to make known to the Board the commercial issues involved, they must not complain that rulings made in the absence of such knowledge result in embarrassment and annoyance.

We trust the reputable dealers will be present and do what they can to assist the Board in intelligently enforcing this law.

We shall soon have to take hold vigorously and systematically of the matter of disinfecting and purifying sewage before turning it into streams. The complaints of pollution of water supplies in all parts of the country are increasing and will continue to increase. The public authorities ought to recognize the fact that a community has no more right to befoul their neighbor's water than an individual has to pollute his own or his neighbor's well. Among recent instances of this sort of procedure is the fact mentioned by a correspondent of the *Trenton State Gazette*, over his own signature, that the sewage of the New Jersey State Lunatic Asylum is discharged into the Delaware River, a short distance above the intake of the Trenton Water Works. This ought not to be, and there is no possible excuse for such a filthy performance on the part of a State. The water closets of the Capitol building might be made to discharge directly into the gutters of Trenton, with as much reason.

The Boston *Herald* of Jan. 29 comments upon our editorial notice of Jan. 25, upon the Massachusetts Conglomerate Board that our criticism was hardly fair. It says:

"There is no doubt but manufacturers have resisted and will resist any movement or legislation that would interfere with their business or entail additional expense upon them. But to say that they have banded together to kill off the the State Board of Health, because it inquired too closely into the nuisances they were creating, and that Mr. Talbot deliberately took position in the Board for the purpose of seeing that no such inquiry should be made in the future, are things that few persons in this State will believe. At the same time, it cannot but be admitted that it would be better that the State Board of Health should have an independent existence and individuality, as its mission—if it have ny—must necessarily be a singular and special one. THE SANITARY ENGINEER, no doubt, aims only at what it conceives to be the public good, and its utterances should therefore be entitled to consideration if not respect."

THE SANITARY ENGINEER does not wish to do injustice to anyone, and after further inquiry we are satisfied that while Mr. Talbot is opposed to legislation upon the subject of river pollution, yet it is not probable that he deliberately crippled the State Board of Health in order to prevent further investigation into this subject—an inference which might be drawn from our editorial.

But, while admitting that his action may have been due to a desire for economy and other proper motives, we think there can be no doubt that the results have been most unsatisfactory, and that his sneers at the medical men and sanitarians of the State indicate that he is exceedingly narrow in the view which he takes of the subject of public health.

What the source is from which the furnace draws its air supply will at this season largely determine the purity or impurity of the air in the house. The setting of the furnace is too often left to ignorant tinkers who know nothing about the proper methods, and we are informed by one of the principal furnace manufacturers that it is a common thing to find the air supply pipe entirely omitted, and the furnace drawing its air from the cellar. Of course, the consequence is, that as the air of the cellar is never of the best, and often polluted with decaying vegetables or fruits, its noxious qualities are distributed over the house. Two instances came to our notice last week when just such nuisances were caused in just such a way—by collections of vegetables near furnaces which had no outside air connection. It ought to be understood that a furnace is a powerful force pump, which will draw its air from the nearest source, and force it into the living rooms. If that source happens to be a cellar drain, as it was in a case we described last winter, then we have put a pump upon the sewer to draw its air indoors. It has been suggested that manufacturers of furnaces should send with them a sheet, giving plain directions for setting and connecting the furnace. If these did not enlighten the tinker, at least they would catch the owner's eye and direct his attention to what ought to be done.

From the report of a recent meeting of the Chicago Master Plumbers' Association printed in our last issue, it is evident that the majority of those present had a proper and enlightened view of the purposes and province of such organizations. It is with much pleasure that we note a disposition to taboo "unworthy members of the craft who willfully do a bad job, and generally are botches." It was also proposed "to submit to the press and public instructions regarding the best mode of taking care of a heated water-back so as to further instruct the people as to their use." This is indeed progress. Six years ago the latter proposition would have been assailed by many as "giving away the trade." We heartily congratulate the Chicago Association on this evidence of their public spirit and true appreciation of the position of the craft in its relations to the public. Public respect and influence will be secured by any association that is controlled by such liberal and enlightened ideas. Philadelphia has just organized a Plumbers' Society, and we commend to them the action of their Chicago brethren.

A house near Regents Park in London was recently burned down in the presence of the firemen, who were powerless to prevent it because the turn-cocks, who are relied on to turn on the water, could not be found. It seems that neither the police nor the fire brigade are permitted to have a key to turn on the water, and the turn-cocks, as stated by a writer in the *Times*, "have duties to attend to out of doors, and are not always to be found at home when wanted." Confessedly, this is a disgracefully stupid condition of affairs to be tolerated in the nineteenth century, and in the metropolis of Great Britain.

The city of Cleveland has an enviable prominence for the attention it has bestowed for some time past on the condition of its school houses. At the beginning of the last school year the Board of Education directed the Superintendent to report on this subject. Mr. Hinsdale has complied, and presents facts which show how unfavorable to health is the situation of a good part of the children during their school hours, for it is not to be supposed that the school houses of Cleveland are worse than the average, but the authorities have had the real facts got at as the first step in improvement. Seven thousand children are in school rooms which cannot be properly warmed in cold weather; thirteen hundred are in rented rooms, ranging from a church to a remodelled stable; five schools are in basements of school houses, and two of them have been pronounced by the health officers unfit for use in winter. The cause of these evils is overcrowding. The total capacity of the school rooms exceeds the number of school children, but the system of grading, the location and other causes, prevent the equal distribution of the children among the schools.

PLUMBING IN "THE BERKSHIRE."

In the new apartment house called "The Berkshire," at the corner of Madison avenue and 52d street, of which Mr. Carl Pfeiffer is the architect and Mr. Harkness Boyd the plumber, there are some features of interest to plumbers, especially in the method of water supply, which is, of course, quite extensive in a building of this class, nine stories high, and covering a lot about 75 by 90 feet.

We will briefly outline the method of distribution by following (with the aid of the diagram on page 245) the course of the water from its admission to the house to its delivery at the fixtures. (The relative positions of the various objects represented have been considerably changed for convenience of illustration.)

The supply pipes throughout are of galvanized iron, except short lead connections to fixtures. The vertical lines are generally carried in accessible recessess in the walls. There are no considerable lengths of horizontal pipe above the cellar; here they are generally suspended from the floor beams. There are two 2-inch service pipes (*a*, *a*,) from the street, each of which has a meter, *b*, attached to it, the two pipes being connected with each other on the street side of the meter, so that either meter may register the flow through either one or both services. Thence the whole supply passes through the pipes *c*, *c* into a cistern *d*, of about 4,000 galions capacity, situated outside the foundation wall directly behind the meter and under the front stoop. A ball-cock on the end of the pipe regulates the supply, and a 3-inch overflow, *e*, discharges over a sink as shown. This cistern is used only as a reservoir from which the steam pump *g* draws its supply through the pipe *f*, to prevent injuring the meters, as there would be danger of doing by pumping directly from them. The suction pipe of the pump is, however, connected with the pipes leading from the meters to the cistern, so that the supply may be drawn directly from the meters, if necessary. The supply to all the fixtures is then forced through the 2-inch pipe *h* to the tanks on the roof (a height of about 125 feet), from which it is all returned to the cellar through the 2-inch pipe *j*, which is the main cold supply, and the 1½-inch pipe *l*, which supplies the hot water reservoir *m*.

The tanks are actually farther apart than shown—about 35 feet—and the man-hole cover seen on top is more nearly over the place where the pipes come up. They are closed tanks of iron, sheathed with wood and covered with tin. It is designed to have steam coils under them to prevent the water from freezing. The two are connected by the branch pipe *k* from the down supply, and have a combined capacity of about 4,500 gallons. The overflow is upon the tiled roof and the tell-tale, *p*, to a sink in the cellar. From the foot of the main down supply 2-inch horizontal lines are carried along the cellar ceiling to all the different lines of waste pipes, and from these points vertical risers taken to the highest fixtures. The largest of these are 1½ inches in diameter.

The hot water from the cylindrical iron reservoir *m* (of about 1,000 gallons capacity), is distributed in the same way through the pipe *o* and its branches, being heated by a 3-inch steam coil arranged horizontally in the reservoir at the height shown by the dotted lines. The several vertical lines of the hot water pipes are united above the highest fixtures which they serve, and extend up through the tank by a ¾-inch pipe having a return bend, *o'* at the top, as shown. There are no return circulation pipes.

A separate system of pipes for furnishing filtered drinking water to the kitchen is not shown in the sketch. The supply is taken from the tanks on the roof through galvanized iron pipes to two cylindrical charcoal filters (measuring three feet in diameter and six feet high) in the cellar, from which it is distributed to the different apartments.

The drainage system we shall not fully describe at present. In most respects it is not peculiar, but in simple accordance with the requirements and recommendations of the Board of Health. The method of disposing of the refrigerator waste and rain water from the roof, however, is noteworthy. The refrigerators used are a kind which has a slight trap attached to the waste. They are arranged one above another in vertical lines and accompanied by 2-inch waste pipes *r* (connected with no other class of fixtures), into which each refrigerator discharges through a 1-inch branch, on which is no other trap than that mentioned above. The main lines unite in the cellar, and after passing an S-trap discharge into a large underground roof-water cistern in the court, from which the hydraulic elevator is supplied. The overflow from this large cistern enters a smaller one under the cellar, which in turn discharges into the house drain, a double trap being formed in the latter by the inlet and outlet dipping below the water line.

AN IDEAL SANITARY DWELLING.

MR. JAMES C. BAYLES' LECTURE BEFORE THE MASTER PLUMBERS' ASSOCIATION.

Notwithstanding the rain and slippery streets, a large audience of plumbers with their families and friends was present in Steinway Hall on Tuesday evening of last week (Feb. 6), to hear Mr. James C. Bayles, editor of *Iron Age*, deliver the third lecture in the course of entertainments given by the Master Plumbers' Association of this city.

"No. 26 Daydream Avenue," which had been announced as the lecturer's subject, proved to be his idea of a model city dwelling, and his lecture consisted of a description of this ideal house which had been, in imagination, constructed for him in accordance with his ideas—particularly of the drainage, plumbing and heating.

The house was located in this city, and on a lot of ordinary size, but in the selection of a site great care was taken that it be on natural and not on filled ground, and especially not over a natural water course, or on ground impregnated with water. The neighborhood was good and there were no nuisances around.

To prepare plans and specifications a reputable architect was selected. The general plans, after some slight changes to suit the individual tastes of his family, were accepted, but not the specifications; the latter were of the usual ready-made, slip-shod style which mean nothing and fit anything with a little filling-in. The specifications for the plumber were very loose and allowed him the utmost liberty, provided he did things in a manner satisfactory to the *architect*; the *owner* might have nothing to say as to how it should be done. He, therefore, had "common sense" specifications made for each department, and detailed plans made. Specialists in each line of work were consulted, and it did not take long to learn that his architect knew little about healthy houses. Accordingly, instead of employing him further he sought and secured a competent superintendent for the work at a percentage very little greater than the architect would have charged. Bids were asked for from reputable builders; four were received, differing but little from each other in amount. Built in this way his house cost more than if he had retained the architect, and probably would bring no more if he wanted to sell it, but he had the satisfaction of feeling that everything had been well and thoroughly done in an approved manner. The ordinary contract system was a delusion and a snare, but it was useless to quarrel against it so long as people continue to demand the most show for the least money.

The speaker then invited his hearers to inspect with him the house as completed. He would first take them to the cellar. There they would find no water or mould. The nature of the site was such that drainage of the ground was unnecessary or inconvenient, but all moisture was kept out by a layer of asphalt between two layers of cement. There were no pipes underground. The soil pipe was of heavy cast-iron with lead joints, and continued along the cellar wall straight to the sewer, with all the grade allowed by the height of the cellar. It had no trap on it. The lecturer was well aware that this was in violation of the Board of Health regulations; but this was not an actual but his ideal house. If he were actually constructing a house in this city he would comply with the Board's rules, and would advise everybody to comply with them, though believing them wrong and working to have them changed. The speaker seemed very positive in his convictions that a trap on the house drain was a worse than useless obstruction. He thought every citizen should contribute to the ventilation of the public sewer, and if the pipe through his house was tight it could be done with absolute safety. The trap, he said, prevented a thorough flushing of the drain, and was the source of much of what was called "sewer-gas." He would rather go down in the man-hole of a public sewer, if he knew he should not become asphyxiated, than admit a little air from a filthy drain pipe into his bedroom. Ask anyone who had visited many new houses standing long unoccupied since their completion, whether they ever detected any odor of "sewer-gas" in them. Their replies would throw a flood of light on the subject of house drains.

The soil pipe was four inches in diameter. It was as heavy as he could get and ran straight up through the roof. The basins had a separate line of two-inch waste. A ventilating shaft from the bath rooms was carried up against his neighbor's chimney to create a draft in it; when this did not heat it sufficiently the draft was increased by a gas jet connected with it. The air pipe connecting with the traps of fixtures did not enter the soil pipe above the highest fixture, but ran independently through the roof. The overflows were into the safes, which had wastes discharging into a box in the cellar. No fixtures were boxed in, nothing was covered; no pipes were out of sight, except the connection between the basin line and the soil pipe and that was accessible without breaking the plaster. The service pipes were iron.

In concluding his description of the plumbing, the speaker renewed his argument against the house trap. In reply to those who claimed that the air within the soil pipe and house drain was kept in constant circulation and hence comparatively pure by means of a fresh air inlet, he said that the latter was in danger of becoming closed by accummulations at the point of its connection with the drain; and to those who cried danger of contagion through the public sewer, he had never seen any evidence of it, and would rather risk this possible danger than the known and demonstrable danger of the house trap.

For heating his ideal house he had considered the various methods and adopted the hot air furnace. It was cheaper than others, and the objections commonly urged against it were due to causes easily prevented. The most common defects of the furnace system of heating were improperly constructed furnaces—poor iron and joints, and defective flues—over heating, occasioned by having too small a furnace for the space to be heated; a foul source of air supply, and poor ventilation. He had two furnaces—a small one for moderately cold weather, and a larger one for very cold weather—of adequate size to furnish all the heat needed without burning the organic dust of the air. The supply was taken from twelve feet above the ground between the windows of the rear extension. The following was a good test for a furnace: throw into the fire-box old boots, arctic overshoes and marrow bones; then turn on the indirect damper; there should be no perceptible odor from the registers. By insisting on this test in bargaining for a furnace any man could get a good one, though he might have to go to a good many dealers before he found one to accept that condition.

For the ventilation of a small dwelling he did not advocate mechanical means. Fireplaces were found in the principal rooms at "No. 26," and that in the library was used to give cheer and brightness to the room as well as ventilate. In the smaller rooms fresh air was obtained through doors and windows.

The lecture concluded with a description of the interior finish and decorations. Hardwood floors were found in the better rooms and stained pine in the others. Rugs took the place of fixed carpets. There was no annual house-cleaning in "No. 26;" "we *keep* our house clean." Neither were there any poisonous wall papers. The lower portion of the walls were plainly decorated in water colors and the upper part and ceilings were elaborately and expensively frescoed in water colors and bronzes.

The next and concluding lecture of the course will be given in Steinway Hall on the evening of March 1, by the Rev. Howard Crosby; subject: "The Glory and Shame of New York."

Newport R. I. *News* says that an interesting little book is in the Redwood Library. It is entitled "Address of the Royal Jennerian Society for the Extermination of the Small-pox," with the Plan, Regulations and Instructions for Vaccine Inoculation. It was printed in London in 1803, and an autograph letter from Dr. Jenner, shows it was presented by him to a Mr. J. Monroe, of London.

SANITARY INSPECTION OF HOUSES.*

The objects to be aimed at in constructing a system of house drainage are as follows:

First. All matter placed in any of the sanitary appliances in the house must be carried, with the greatest possible expedition, clear of the premises, leaving behind it as little deposit as possible.

Second. All sewer air must be prevented from entering the houses by the channels which serve to carry away the sewage.

Third. Since it is impossible to have house drains absolutely clean, that is, devoid of all decomposing matter, all air from house drains, and even from sink, bath, and other waste pipes must be kept out of the dwelling rooms.

To which might be added a fourth, that a constant current of fresh air must be established along every pipe in which it is possible that any decomposing matter may remain, so that such matter may be rapidly oxidised, or rendered innocuous.

The number of houses in which we find the drainage arrangements to be thoroughly good, and to be fulfilling these conditions, is surprisingly small. In fact, I may say, that in all the houses we are called upon to examine, except those which have been arranged, within the last dozen years or so, by some engineer, builder, or plumber who has made a special study of the matter, we find defects which interfere with the due fulfillment of one or other of these conditions.

I call your attention to defects quite commonly discovered in a London house. I have seen individual houses in which the drainage is more defective. In fact, I should describe the house illustrated now as somewhat below the average of the better class London house, as regards drainage arrangements.

The first point is the condition of the main drain. It is little other than an elongated cesspool. The size is unnecessarily large. As a consequence, even if it were perfect in all other respects, it would not be self-cleansing, inasmuch as there can never pass down the drain which serves for a single house enough water to scour out pipes of the size illustrated, namely 9-inch diameter.

The state of affairs, however, is far from correct, apart from the size of the pipes. In the first place, the joints are not tight; sewage will soak out into the ground through them. In the second place, although there is ample allowance between the two ends of the drain for a good fall, or incline, this fall has all been confined to a few feet of its length, the part underneath the house being laid almost level. This is done simply to avoid the trouble of excavating the ground to a sufficient depth. It is probable that, while the drain is new and the ground comparatively solid around it, sufficient water will remain in it to carry the greater part of the sewage to the sewer. But this state of affairs will not last; before long, some unusually heavy or obstinate matter will get into the drain; it will be carried only so far and then will stick. Any water now coming behind it will "back up," to a certain extent, and will very soon find its way into the soil, from one or more points behind the obstruction—not yet amounting to a stoppage. As a consequence, sewage now passing into the drain, loses its carrying power, and gets no farther than a certain distance. Before long a complete stoppage takes place, and all the sewage of the house soaks into the ground under the basement. After this, things go from bad to worse. The saturated ground no longer properly supports the pipes, which, as a consequence, will become more and more irregular, and all hope of the drain clearing itself is lost. It is only a question of time, with a drain such as I have shown, and the inmates of the house will be living over a cesspool.

As a matter of fact, total obstruction or stoppage has been discovered in six per cent. of the houses which we have inspected.

The soil pipe is of lead. This is an excellent material, if the pipe be properly arranged, but here it is not. The great fault is that there is no ventilation. As a consequence, the upper part of the pipe will always be filled with sewer gas, which tends to rise in a somewhat concentrated state. Now, sewer gas has a powerful action on lead, and, therefore, a soil pipe arranged without ventilation never stands many years before it becomes "holed;" that is to say, is worn through at its upper part. When this occurs, of course there is ventilation enough, but it is into the house. The ventilation in this case will, in fact, be most active, because every house, on account of the fires in it, acts, especially in winter, as a chimney, and draws in sewer or other gas from every possible crevice.

Now, although the constructor has not ventilated his soil pipe, he has been careful not to leave the system entirely without ventilation. On the contrary, by the simple device of leaving a rain-water pipe untrapped at the foot, he has ventilated the drains, and also the public sewer, into the back bedroom windows! This is a quite common arrangement. I have, within the last two months, seen two cases in which it has resulted in typhoid fever. In each case, the children slept in rooms, the windows of which were within a few feet of the upper ends of rain-water pipes, left untrapped, either through carelessness or through the idea that they would be useful as ventilators.

The only ventilation in this case is such as will permit the issuing sewer gas to find its way into the house. It is by no means unusual to find no provision at all for ventilation, or to find the ventilating-pipes so small that they are totally useless. In more cases than one I have found the soil-pipe carried up as a rain-water pipe into the attics, where it received rain water from two gutters, one from each side of the roof, and discharged all the sewer gas which escaped by it. Generally, the drinking water cisterns are situated in such attics.

Water, even in London, is almost always delivered in a sufficiently pure state to be drank, but it is a very common thing for it to be contaminated in the cisterns. Even if there be no actual disease germs carried into the water, there is liability of deterioration from the mere fact of a large quantity of water being stored for a long time before use. If the cisterns are of so great size as to hold as much water as is used in, say, three or four days, it follows that all water drawn has remained in these cisterns for an average time of several days. There are far more dangerous causes of contamination than this, however. The commonest of these is to be found in direct communication between the drains and cisterns through the overflow-pipes of the latter. A trap on the pipe by way of protection against the sewer gas is by no means an uncommon arrangement; but as will be readily understood, such a trap is absolutely of no good. An overflow pipe to a cistern is merely an appliance to be put in use in case of an emergency; that is, in case of derangement of the ball valve through which the water enters. As a matter of fact, an overflow may not occur from year's end to year's end—probably does not—and, as a consequence, the trap soon becomes dry, and the temporary security afforded by it is lost. In 37 per cent. of houses inspected we have found direct communication between the drain or soil-pipes and the drinking-water cisterns.

Another means by which the water of cisterns is contaminated is by their being placed in improper positions. Quite frequently, a cistern in which drinking-water is stored, is situated in, or even under, the floor of a water closet. I have known more than one case in which the drip-tray under a closet actually discharged into a cistern.

A paper on the subject of inspection of houses would be quite incomplete were it to contain only an account of the defects to be found, and to leave out altogether any description of the methods in use for discovering such defects. One thing that is absolutely necessary for such inspection, and without which it would be quite incomplete, is to open down to the drain. This should be done at the nearest point to that at which it leaves the premises. There is no absolute guide to tell where this point is, but after some experience it is generally possible to hit upon the spot with very little searching. The ground should be entirely removed from the drain for at least two lengths of pipe. It is also very desirable that a portion of the ground over the top portion of the drain should be removed.

We may next take the point of trapping of the main drain and ventilation of the system. It will be seen that the drain is shown to be in direct communication with the sewer. The consequence is that any leakage which may exist in the house drain permits gas not only from the drain itself, but from the sewer also, to find its way into the house.

The engineer will now be able to tell much of the state of affairs. He will see of what size the drain is; he will be able to tell of what material the joints are made, taking those exposed as samples; he will, in all probability, find the ground under the pipes soaked with sewage, and be able at once to say that the drain is in a leaky and bad condition; he will find whether it is properly supported on concrete, or has been "tumbled" into the soil; he will be able readily to discover what is the total fall in the drain from back to front. At this stage of the proceedings, the drain itself should not be opened; but, on the contrary, if the taking up of the ground should have exposed any joints which are evidently leaking, these should be made temporarily good with clay. The reason is, that it is desirable, before anything has been disturbed, to test the system for the purpose of discovering what amount of leakage there is into the house.

There are various ways of doing this, but the two commonest, which I intend to describe and illustrate to you are those known as the "peppermint test" and the "smoke test."

It will be quite evident that it is no use to pour peppermint into any of the appliances in the house, as, were such done, this smell would so rapidly permeate the whole of the premises, by way of the staircase, passages, etc., that time would not be allowed to detect the leakages. Some means must be discovered of getting the peppermint in from the outside. This is not always possible, but generally it is. In the case illustrated, there would be no difficulty. The rainwater pipe at the back admirably suits the purpose. One person gets out on the flat roof, near the top of the pipe, and provides himself with peppermint, and four or five gallons of water, as nearly boiling as possible. Meantime, all doors and windows are closely shut, and persons are stationed about the house to observe if the smell expected becomes evident, and to locate, as far as possible, the point from which it issues. The man on the roof pours about half an ounce of the oil down the pipe, and follows it with the hot water. As soon as possible he plugs up the top of the pipe with a towel, or some such thing, to prevent the occurrence of the vacuum which would otherwise be in the pipes, and which would tend to draw air from the house into the pipes instead of from the pipes into the house at any leakage. It would be probably not a minute before the people in the house would perceive the smell at various places. The manipulator of the peppermint must remain perched on the roof until those inside have had time to make their observations, otherwise he will infallibly bring the smell with him.

The test described is an excellent one. It is searching and is simple in application, but it has one drawback. It is impossible by means of it exactly to localize a leakage. This drawback does not apply to the smoke test. The smoke machine is nothing more nor less than a centrifugal pump attached to a vessel for generating smoke. The pump pumps smoke out by a pipe, which may be inserted in any pipe in direct communication with the drain or in an aperture made for the purpose. The test is, in all respects, similar to the peppermint one, except that the leakage is not smelt but seen, and as we all know seeing is believing.

After the test has been performed the drain may be opened by breaking into a pipe in front, by breaking off a collar, or by punching a round hole in the pipe. In any case it will be possible to judge much of the condition of the drain by the manner in which water runs through the pipes. If we have discovered that there is sufficient total fall we can now see whether or not it is uniform.

If the drain, after all tests so far applied, and from what can be seen of it, appear to be in good condition, it may be further tested by filling, or attempting to fill it with water. There is probably not an average of one drain in a thousand in London which would remain full of water for an hour. For the rest it is necessary to examine all appliances, to trace the pipes from them, and sometimes to test these pipes.

The engineer has now completed his inspection, and has but to consider how he will make the best of a bad job, and put things to rights. At the beginning of my paper I expressed my intention of confining myself to a description of defects, and said I should not describe what I considered a perfect system. I shall, however, point out to you one or two of the chief features of the arrangements in the house which I call well drained.

Most notable, probably, is the small size and sharp fall of the drain pipes. Further than this the drain is disconnected from the sewer by a trap which is accessible for inspection throughout, simply by lifting certain iron covers. A close examination would show that every foot of drain pipe and discharge pipe is so ventilated, that there will be a current of air through it; that no appliance discharges into the drain direct, but that there is an atmospheric disconnection in every case; that air from discharge pipes of sinks, etc., is all trapped from the house; that there is separate water supply for closets, and for other purposes; and that no cistern has any connection with the drains.

* From a paper read before the Society of Arts, London, by W. K. Burton.

MEMPHIS WATER SUPPLY.

We have several times had occasion to comment on the bad quality of the water supply of Memphis which is taken from Wolf River, a small tributary of the Mississippi, and have pointed out that this water supply is probably one of the special causes of the high mortality of the city for the last two or three years, and especially of dysenteric and other bowel affections.

We now give a copy of a section prepared by a competent engineer, which we think is very interesting.

It is a section of the stomach of a man who has been using the Wolf River water for 12 years, and while, like all geological sections, it is no doubt in part diagrammatic, we can say of it in the words of the old Italian proverb, "*Si non E vero, E ben trovat o.*" *i. e.*, if it is not true, it is well described.

Typhoid fever is still prevalent both in London and in Paris. In spite of the progress made in sanitary matters and the improved systems of drainage, I cannot help thinking, from my own personal experience of both cities, that much still remains to be done, and that the present state of affairs is accountable for much of the typhoid now prevalent. In London, if not in Paris, the main drainage system is now complete and mostly in good order, but the drainage of individual houses is often defective. I have been in many West-end houses in which the water-closets were placed in the center of the house and ventilated only on to the staircase. I noticed this arrangement in the town house of the late Earl of Beaconsfield in which he died.—*Correspondent of the Medical Record.*

PLUMBING IN FORT WAYNE, IND.

To the Editor of THE SANITARY ENGINEER:

I have been a constant reader of your valuable journal for several months, and have taken an interest in the valuable letters written, and suggestions and facts given, and have tried to put them to practical use. I am not sure whether you receive sketches or drawings from your readers or not, but I have sent to you a sketch of one of the first pieces of work that has been done in our city with a thorough ventilation of the waste pipes from the crowns of the traps. It has been customary for several years with our best plumbers to extend the soil pipes out at the top of the roof, but there has not been any ventilation of the traps.

The plumbers, Messrs. Hattersly & Son, are the contractors, and are doing the work under our supervision. All waste pipes are either cast iron or lead, all iron pipes coated on either side with mineral paint, all joints caulked with lead.

All lead connections to iron pipes are made through brass ferrules. Waste pipe from ice chest, sediment pipe from boiler, safe wastes discharge into the sink in the basement. Ventilation pipe *C* extends above the roof, no windows near it on third floor.

The soil pipe is 4", except that in the basement, as shown, it is 5", and connects with the sewer outside of the walls of the building. The upper end of the soil pipe runs to the attic, and thence into a hot air chamber at side of kitchen flue and from flue to the steam boiler. The bath room itself is also ventilated into a separate flue between these hot air flues.

Bower traps are used below the fixtures instead of traps as shown. The pipe *D C* is supply from the street with stop and waste inside of the stone wall; all of the pipe is graded to the stop, and waste connections are made with the boiler as shown, in case it should be needed. You will notice that there is direct connection with the closet. We advised the use of the cistern, but there was objection raised by the owner on account of expense. It has been the habit here to connect directly to the closet, as we have an abundant supply of water. Will you please state your objections to the direct connection? The pipe *F* is supply from the tank. The pipe *E* cold water supply, and pipe *F* supply hot and cold water to dressing room in front part of the house, and the basin wastes into the 2" cast iron waste below kitchen sink. The trap to basin is ventilated separately out at the top of the roof. We are not sure that all of these ideas and plans are exactly to your liking or your approval, but we have been the first ones to try and make a change in the customary way of doing work here; hoping there are a few things that will meet your approval we remain,

Yours respectfully, J. F. WING.

P. S. Stop cock on the supply from and to the tank, also expansion pipe from the boiler.

[It is gratifying to learn of the interest taken in plumbing work at Fort Wayne, and to see this evidence of progress; and it affords us pleasure to admit that we have no recollection of ever having received from a correspondent a better drawn view of the plumbing of a house than the one we here reproduce.

We notice an omission of the fresh air inlet, and from the description it is not clear whether the soil pipe extends beyond the roof, or terminates in a heated flue. We should prefer the former disposition of it.

The objections urged against direct (or valve) supply to water closets are the probability of contaminating the drinking water supply, the wastefulness of these valves, and the ineffectual flush as compared with a properly constructed cistern. This whole question was very fully discussed in THE SANITARY ENGINEER last year (see issues of March 30, and April 6, 1882.)

We are always glad to receive illustrated descriptions of work done outside of this city.]

EXPLOSION OF WATER-BACKS

IOWA STATE BOARD OF HEALTH,
OFFICE OF THE SECRETARY,
DES MOINES, *Feb.* 2, 1883.

To the Editor of THE SANITARY ENGINEER:

The excessively cold weather of this winter is giving the usual trouble in regard to the freezing of pipes from boilers to water-backs. Last week in Chicago the explosion of a water-back was attended with loss of life.

I have had to disconnect my boiler and stop its use altogether, owing to the impossibility of preventing the freezing of the connecting pipes.

On two occasions, recently, the pipes were found frozen, and only by the personal precaution of thawing out the pipes previous to lighting the fire, was an explosion avoided. I write this to ask you if it is not possible to devise some contrivance, such as a plug of fusible metal, or a cock to open at a high pressure, which, placed in the water-back, would obviate the danger of explosions when the connecting pipes are frozen? thus putting our cooking stoves and their hot water attachments within the intellectual range and ordinary care of our usual hired help.

Yours truly, R. J. FARQUHARSON.

[We know of no contrivance that can be depended on in emergencies such as you suggest. The only plan is to keep up a good fire and not let the pipes freeze. If by accident the fire goes out, follow the directions contained in an article on page 286, issue of THE SANITARY ENGINEER of March 2, 1882.]

SIZE OF PIPES.

To the Editor of THE SANITARY ENGINEER:

Please inform me the size of lead pipes used for cold and for hot supply in ordinary house with water on three stories. Also, what should be the size of the circulation pipe as compared with the hot water pipe? B.

[The size is somewhat controlled by the ordinary street pressure. A 1-inch main supply from street tap to rear of house, with ¾-inch branch to boiler and as far as the baths, ⅝-inch beyond that, and ½-inch branches to basin cocks and water closet cisterns, will give a good flow at all times. If pressure is very strong and cost is an important consideration, these may be reduced one size. The return hot water circulation pipe should be at least ½-inch.]

CATCH BASINS.

CINCINNATI, *Jan.* 29, 1883.

To the Editor of THE SANITARY ENGINEER:

Mr. Arthur Moore, Superintendent of the Cincinnati Water Works, says that catch basins in the city are a useless expense. The streets gutters should drain directly into the sewers through gratings. Especially in Cincinnati the sewer grades are steep enough and the flow of water sufficient to flush everything into the river. It costs the city from $25,000 to $30,000 per annum to clean out her catch basins. S.

[The question as to the advisability of having catch basins is one to be determined specially for each city, and even for its separate districts. Wherever sufficient facilities are had for a powerful and frequent flushing of the sewers, it would be folly to have catch basins. Wherever flushing is expensive, or the current is at best only sufficiently strong to carry away sewage deposit, but not street silt, it would, on the other hand, be an error to omit them. The expense of cleaning out the silt from the sewers would then be much greater than from the basins, not to speak of the dangerous results from the filling up of the sewers. There are only two cities in the world, namely, Paris and Hamburg, where the basins have been generally omitted with success. Some other towns have left them out in small districts, where sewers could be flushed from small watercourses. But in most cities, under ordinary conditions, the catch basins cannot well be done away with.]

THE POSITION OF EXPANSION TANKS.

KANSAS CITY, MO., *Jan.* 13, 1883.

TO THE EDITOR OF *The Sanitary Engineer:*

I wrote you in December regarding circulation in hot water heating apparatus; your answer does not seem to cover any of my questions. As I may have worded them so as to be understood wrongly, however, I will say that had I required any information I might have been misled by the answer, as you bring an old washing machine or dishwasher into use to illustrate circulation, comparing tubes inclosed with non-conducting surfaces and at most one foot long, with hot water work from 50 to 500 feet in length of 4-inch pipe with radiating surface. Also, in the machines you refer to, the tubes, if made to 4-inch diameter, would not spout a great deal of water, that is if they are used as I have seen them recommended in the directions—to only fill the boiler two-thirds full of water. My object in writing at first was to demonstrate a long contested argument that a more even temperature is gained by having return pipes twice as long as the flow; also to throw out tanks at ends and their large heating surface, which makes the house hottest by 10°, within six to eight feet of them. By having tank at boiler I can get a more even temperature and more rapid flow; that is, the water that leaves the boiler will get back quicker without the tank than with it. If you use illustrations, use something more appropriate to the question involved.

Yours, respectfully, THOS. H. WALKER.

[The preference in this part of the country as far as it is known to the writer, points to the use of the expansion tank at the highest point, at the end of the direct riser from the boiler. The return comes back downwards from the radiators to the boiler, to complete the circuit. This is thought to be most efficient—first, because of the stimulation of the circulation by the rise of vapor bubbles, as noted in our issue of Dec. 12, 1882, and secondly, because the expansion of the water, due to the additional heat, should take place in this direction. Otherwise, the expansion of the water would tend to arrest the circulation. To put the expansion tank on the riser, but close to the boiler, is simply to make the enclosed vapor act like the air cushion in the air chamber of a pump or a ram. It might as well be at the top, and would be under less pressure there. Accident to it would be less injurious to the building also. The air must be gotten rid of by relief valves at top or ends, and there are some advantages in having the vents on the tank. A skillful designer in New York has arranged his tank so that his system will change automatically from an open one for water to a closed circuit or steam system when a certain temperature of water is reached. This is done with the expansion at the top. There is no doubt that the tank at the top will be the hottest part of the job, as the correspondent very justly observes. He also says very truly that long return pipes promote a more rapid flow. This results from the fact that it is the descent of the cold water by gravity which causes the circulation. Hot water has no inherent buoyancy of its own (except in so far as the vapor bubbles are effective), but gravity acting to draw down the denser water, forces upwards the lighter hot water by displacement and sets up the circulation. Any modification of a device which will secure quicker descent of the cooler return water is therefore an obvious improvement. Where a tank acts to prevent quick return to the boiler, the correspondent very wisely suggests to leave it out from that place, and put it somewhere else. Therefore, opinion favors the location of the expansion tank on the upper end, because, looking at it in one way it is more efficient there, and because, from another point of view, it does less harm there and is likely to cause less annoyance by any derangement. But where a forced circulation is made a feature of the design as in most advanced practice, the expansion device may be put anywhere, or may be absorbed into the air-chamber of the pump. By forcing the circulation, not only is the heating surface more efficient in the boiler, but as also is the radiating surface in the rooms, and much less time is required to get the heat of the fire available in distant rooms. But the questions of the correspondent bear only upon gravitating systems, and in these it has been no doubt by his skillful management of detail in other parts that he has been able to secure such good results from arrangements which are not usually considered the most favorable.]

AUTOMATIC RANGE PUMPS.

BRATTLEBORO, VT., *Feb.* 6, 1883.

To the Editor of THE SANITARY ENGINEER:

Being a constant reader and subscriber of your most valuable paper, THE SANITARY ENGINEER, I noticed in last week's issue, page 199, a communication from one B., inquiring about an automatic system of pumping water for domestic purposes. Enclosed please find some circulars of automatic pumps, of the kind you spoke of—some that were sent me some time since. Do not think they are now in the market, as we have heard nothing of them for some time. I send the circulars thinking they may be of some use to you. Respectfully, yours,

P. O. BOX, 158. WM. B. GOULD.

[Our correspondent sends us circulars several years old, of "Houghtons Automatic House Pump, or Water Elevator," and of "The Automatic House-tank Pump." of which J. C. & H. M. Wightman were the inventors. In both the force used is steam generated in the water back, or in a steam generator placed in the kitchen range. We learn that Houghton's pump is sold by William Mills & Co., 235 and 237 Washington street, Boston, but have not been able to learn anything about the present whereabouts of the Wightman Pump. The address given on the circular sent to us is, "The Automatic Pump Company, No. 7 Pearl street, Boston."]

SEWERAGE OF NORFOLK.

NORWICH, CONN., *Jan.* 22, 1883.

To the Editor of THE SANITARY ENGINEER:

In your last issue in an interesting article on the sewerage of Norfolk, Va., by J. H. Humphreys, it is stated that—"It is intended to provide for sewage and sub-soil water only." He then describes the provision for sewage but makes no further mention of the sub-soil water. Will he not explain in what manner he removes the latter?

C. E. CHANDLER.

[We referred the above letter to Major Humphreys, who sends the following reply.]

OFFICE OF THE BOARD OF STREET,
SEWER AND DRAIN COMMISSIONERS,
19 GRANBY ST., NORFOLK, VA., *Feb.* 5, 1883.

To the Editor of THE SANITARY ENGINEER:

Referring to Mr. Chandler's question as to the provision for sub-soil water in the sewer system here, I explain that it is taken into tile drains laid within sewer trenches which discharge into sewer pipes of lower level, and through them into the pump-well. Yours,

J. H. HUMPHREYS.

SEWAGE PUMPING ENGINES.

CLEVELAND, OHIO, *Feb.* 6, 1883.

To the Editor of THE SANITARY ENGINEER:

I want information on sewer engines and machinery; who makes them and where, and whether they have proved successful, etc. By answering you will much oblige,

Yours respectfully,

213 FRANKLIN STREET. E. B. D. LAMATER.

[This probably means engines for pumping sewage. Such an one built for Pullman, Ill., by Cope & Maxwell, is illustrated on page 35 of THE SANITARY ENGINEER, Dec. 14, 1882 E. D. Leavitt has built engines for pumping the Boston sewage, and George H. Corliss built an engine which he intended for the same purpose.]

E. G. LOVE, Ph.D., *Gas Examiner.*

INFLUENCE OF ATMOSPHERIC PRESSURE UPON THE FLASHING POINT.

In November last Professor Abel delivered an address before the Society of Chemical Industry, on "The Flashing Test for Petroleum." In the course of his remarks attention was called to the influence of pressure in determining the flashing point of oils.

Professor Abel is frank in saying that when his test was elaborated this point escaped notice. The matter has recently attracted some attention from certain experiments made in Germany, from which it was concluded that corrections for pressure were necessary.

The German observations, and some difficulties which have recently arisen in the application of the test in India, led Prof. Abel, in association with Mr. B. Redwood, to look into the matter, and they "found that there were certainly very tangible evidences of the influence of barometrical changes upon the flashing point of an oil, provided that the oil was for a sufficient period exposed to the influence of the change in the atmospheric pressure." In order to obtain evidence upon this point, Mr. Redwood proceeded to Switzerland, "taking with him five samples of petroleum of different flashing points, which were subdivided and carefully sealed up in a number of small cans, of such construction as to yield to decided variations in the the height of the barometer."

The following table shows the results of the different tests made.

No. of Sample.	Barometer.	London.	Paris.	Bouveret.	Visp.	Chamounix.	Zermatt.	Riffel.
	Inches.	30	30.15	28.75	27.5	26.42	24.3	21.5
1... ...	Fl'sh'g point	71°	71°	68°	66°	63°	60°	55°
2.....	"	73	73	70	68	64	62	56
3.....	"	76	76	73	71	68	65	63
4.	"	78	78	75	73	70	67	64
5... ...	"	85	85	83	80	78	75	70

Difference in barometer from London obser-tion.—Inches..... 1.25, 2.5, 3.57, 5.7, 8.5

Mean difference in flashing point per inch of barometer..... ...2.05°, 2.0°, 2.24°, 1.93°, 1.76°

The variation in the flashing points of the oils was therefore about 2° Fah. for every inch of barometer. The Germans found a difference of about 1.6°; but Professor Abel remarks that their tests "were made in a pressure apparatus, and probably sufficient time had not elapsed between the alteration of the pressure and the determination of the flashing point for the change in pressure to exert its full influence."

Professor Abel does not express any decision as to the necessity for making corrections, but says that the question "merits more attention and a more complete examination than it has yet received."

It seems clear that the flashing point is influenced to a certain extent by pressure, and where an instrument is used under greatly varying barometrical changes a correction may be desirable or necessary. It is equally clear however that until skilled observers can obtain results with but very slight differences, that is, within one degree, there is little use in making corrections for pressure.

ELECTRIC LIGHT NOTES.

There is talk of lighting Vineland, N. J., with the electric light.

A charter was issued Feb. 8 to the Pennsylvania Electric Light Company of Harrisburg, capital $50,000.

La Lumiere Electrique describes the lighting of the Alliser Theatre in Havana, in which Edison lamps are used. One hundred and ninety-three lamps are used, of which 182 are of one carcel and 11 of two carcel, replacing 342 gas burners. The difference of temperature within the theatre under the new and old conditions is 14° F.

Digitized by Google

Engineering states the Campagnie Trans-Atlantique steamship Normandie will be lighted by electricity throughout, her equipment including side lights and head lights, engine and boiler room lights, steerage lights and hold lights. There are 400 Swan and 16 arc lamps. Sixty accumulators in addition to the Siemen's dynamos will be placed on board. Other vessels now lighted with electric lamps are the Arizona with 300 incandescent lamps; the Antonio Lopez, 70; the Orient, 160 incandescent and four arc lamps: the Austral, 170 incandescent and four arc lamps.

Meter-ites.

The Philadelphia *Inquirer* reports that a workman was suffocated while tapping a gas main in a Manayunk mill.

The Berlin Fire Department has introduced a new feature in their engines. The steam pumps are supplied with reservoirs of liquid carbonic acid. In case the engine reaches the fire before there is a sufficient pressure of steam, the carbonic acid is utilized to drive the pump.

A bill introduced into the California Senate limits the price of gas in cities of more than 100,000 population, limiting the price to private consumers to $1.50 per 1,000 cubic feet.

Food and Drugs.

SPECIAL MEETING OF THE STATE BOARD OF HEALTH.

We are requested to announce the following:

To Manufacturers and Dealers in Food Products:

The New York State Board of Health will hold a special meeting at the School of Mines, Columbia College, on 49th street, near 4th avenue, Saturday, February 24, at 10 o'clock A. M., to take action on exemptions and standards as contemplated by the law to prevent the adulteration of Food and Drugs.

The sections of the law on this subject are as follows:

"*Provided*, that the State Board of Health may, with approval of the Governor, from time to time declare certain articles or preparations to be exempt from the provisions of this act: And provided further, that the provisions of this act shall not apply to mixtures or compounds recognized as ordinary articles of food, provided that the same are not injurious to health, and that the articles are distinctly labelled as a mixture, stating the components of the mixture.

"It shall be the duty of the State Board of Health to prepare and publish from time to time lists of the articles, mixtures, or compounds declared to be exempt from the provisions of this act, in accordance with the preceding section. The State Board of Health shall also from time to time fix the limits of variability permissible in any article of food, or drug, or compound, the standard of which is not established by any national pharmacopœia."

This meeting is held in New York in order to enable manufacturers to appear before the Board and present their views.

The Board will be glad to receive communications, either in person or in writing, with regard to exemptions and standards that are desired.

THE RULINGS AS TO MIXTURES.

To the Editor of THE SANITARY ENGINEER:

In answer to your request for the views of manufacturers on the recently published rulings of the State Board of Health which requires the stating of the constituent proportions of permissible mixtures on the label, we would say that so far as we are concerned we care little about it, as our business is mostly in whole spices, and the spices we grind are almost entirely pure.

On the grounds of public policy, however, we are opposed to that ruling which would compel the merchant to state on the label what the mixture is and its exact proportions. We regard the English law as all that is necessary, and it is a great mistake to compel the grinder of coffees and spices to state the ingredients and the proportions of each.

If the question is raised that unless the names of the constituents are stated on the label, the public have no guarantee that injurious ingredients have not been used in the preparation of the mixture, we would say that as the State Board of Health prescribes what articles may be used as mixtures, and therefore only such articles can be used, that is sufficient guarantee to the public.

This ruling also bears on the question of trade-marks of special combinations, which have secured a reputation with the public, and we would say that in our opinion it publishes to the world the secrets of a man's business, and destroys all property interests in what he has spent his money to build up.

In fact your comments on this subject in your last issue we think expresses the views of honest and reputable manufacturers.

Yours, very respectfully,

123 Maiden Lane. PACKARD & JAMES.

To the Editor of THE SANITARY ENGINEER:

Referring to your recent comments on the State Board of Health rulings, I would say that I believe in publishing what the constituents are, but as to publishing the proportions that is another thing. I should object to a ruling which would compel me to publish just what the proportions of each grade of our mustards are. This is information which other manufacturers would give much to obtain, and customers who now come to us for special grades would then prepare them themselves. If the mixture is within the law it is not necessary to state what the exact proportions may be. It has been our practice to inform our customers of what they were buying by publishing on the package a notice to this effect: "This mustard is not pure, but the ingredients improve the quality and make it a proper consistency," and under the law we regard this as giving the public all the protection they can need.

We ourselves, would favor an absolutely pure mustard, but practically the public will not have it. They have been so long used to the mixed article that now if they buy the pure mustard it is so strong they regard it as adulterated. We find that a mixed mustard will sell three times to one which is pure, and we regard a mustard which has 50 per cent. of the pure article is better than one which has no foreign ingredients.

We consider that the action of the Board will principally effect the retail dealers, who will have on their hands an article which does not conform to their rulings. If the manufacturer would replace this with articles conforming to the law the retail dealer would be secured; but this will not be done, and it will be a serious matter with them.

Yours very truly,

257 Bowery. CHARLES L. STICKNEY,
Importer and Manufacturer of Mustards.

To the Editor of THE SANITARY ENGINEER:

In reading the recent decisions of the New York State Board of Health, concerning the adulteration of coffees and spices, our attention has been drawn to, what seems to us, the great injustice of some of their rules and requirements. For example, they declare as exempt, under the adulteration law, a coffee and chicory mixture, to which no other substance is added, but they prescribe that the proportion of pure coffee, in the mixture, shall not be *less than fifty* per cent. The requirement is also laid down that "the labels on such mixture shall be plainly and distinctly marked in letters of the same size as in the whole name of the mixture, so as to be read on one side of the parcel or package containing the mixture, in whatever quantity the same be sold, and the proportions of the two above designated parts (chicory and coffee) of the said mixtures shall in each case be distinctly marked and published on the said labels."

The question first in order might be, if, when articles for food or drink are exempted under the adulteration law, as wholesome and healthful, for the people to use at all, why should not the Board properly permit the mixture of those articles or substances, by the manufacturer, in such proportions as he may adopt? Not only this, but is it not an injustice to the manufacturer to deprive him of protection for his formula or trade-mark by compelling him by law to advertise them upon his labels, openly to the general public?

The compounding and blending of even coffee and chicory, so as to suit the popular taste, may be so much of an art, in its way, as to be worth money to the person possessing such a recipe. It is a secret of his business, and it has a value to him, inasmuch as it is a source of revenue to him. In that sense it is just as much a part of his property as any article or commodity he may own.

If the articles of chicory and coffee are healthful enough for general use *at all*, why are they not just as "healthful" in one proportion as another? Yet the "Board of Health" ordain that hereafter the legal limit of admixture of coffee and chicory is placed at fifty per cent. of each. This leads us also to refer to the decision of the Board of Health, limiting coffee mixtures to simply the component parts of coffee and chicory alone. There are other substances, of vegetable nature, entirely harmless in their effects, that have been heretofore largely used for mixing with coffee to reduce the cost. Roasted and ground peas, barley, wheat, rye, etc., besides being much cheaper, are much less injurious to many people, especially those of delicate nervous organization, than coffee when used alone as a beverage. Besides this, there is a large demand for *cheap* coffees that may not be produced at the required cost, without the admixture of some ingredients like those of cereal or vegetable nature. The result cannot be produced by the use of chicory alone. The mixture of fifty per cent. each, of pure coffee and chicory would be repulsive to ninety-nine out of every hundred consumers of coffee. Cheap coffees are demanded just as much as those of higher grade, but they cannot always be compounded according to the formala prescribed by the Board of Health.

WRIGHT, GILLIES & BRO.

237 WASHINGTON ST.

FALSIFICATION OF BRANDY.

A lamentable picture has been drawn in a recent report of the American Consul at Rochelle of the falsification of brandy, which, it appears, in the last three years has undergone a complete transformation, and is no longer brandy, the greater portion being prepared from alcohol of grain, potatoes, or beet. The most unsatisfactory circumstance is that even the merchants who desire to purchase a pure Cognac cannot be certain that they do so, for the proprietors of the vineyards, all of whom are distillers, have become so clever in the manipulation of the alcohols and the accompanying drugs that they deliberately make a brandy of any required year or quality. The mention of the years 1849 or 1876, for instance, in an invoice or on a label, means simply that article is presumed to have the taste or color of the brandies of those years. The increasing importation of German potato and beet alcohols into the Charente ports is an additional proof that the less brandy that is consumed the better for the health and intellect of the consumer. It is, moreover, becoming a custom to sell the brandy in 12-bottle cases, marked with one, two or three stars, according to the presumed quality, thus avoiding any compromising mention of year or place of production. Some of the manufacturers import the small raisins from the East, and make what they call brandy from the juice, there being at least one such establishment in operation at Cognac. Apart from the unsatisfactory purchase of a brandy which is not a brandy, drinkers should seriously consider what are the properties of the liquid which they are so complacently imbibing. It is simply an active poison, the imported alcohol, which is known to the trade as "*trois-six*," being of 90° strength, and sold at a little less than three francs a gallon. Its characteristic effect is to produce an intoxication in which the patient is especially inclined to rage and physical violence, while insanity, of an obstinate and almost hopeless form, is the inevitable consequence of a prolonged use of it. It is said that the great increase of violent and brutish crimes in France may be traced to the drinking of this brandy and absinthe. The slang term for a glass of Cognac is *un pétrole*, and for coffee with Cognac *un grand deuil*. Not only in France, but in other countries, and even in the United States, these liquors are producing a condition of national alcoholism of the worst kind, far beyond the ordinary drunkenness arising from unadulterated intoxicating drinks.—*London Times.*

MUSTARD CASES.

Three grocers, Simon Steiermann, 926 Second avenue, Philip Greifenstein, 833 Tenth avenue, and Charles Sinnigen, 1002 Second avenue, were arraigned before the Court of Special Sessions, on Feb. 9, on complaint of A. L. Colby, Inspector of the State Board of Health, for selling to him mustard which proved, on analysis, to be largely adulterated with common flour. All plead guilty, and were fined by the court $10 each.

The Reading *Times* advises the people of Philadelphia to let the Schuylkill alone and to take their water from the Perkiomen, an unpolluted stream. The advice is not so bad as far as the drinking water for Philadelphia is concerned, but it would not prevent the river water from being offensive as long as Reading is allowed to pour its filth into the Schuylkill.

CONNECTING STEAM HEATING APPARATUS WITH STEAM ENGINE BOILER.

QUEBEC, CANADA, *Jan.* 26, 1883.

To the Editor of THE SANITARY ENGINEER:

Being a subscriber to your paper, I beg to inquire of you the reason why my heating apparatus does not work, hoping you will answer it. I use steam to heat a four story building; the boiler is in the cellar, and carries 45 pounds. It furnishes steam to run an engine and elevator.

In the first story there are 3 coils 4 ft. long, 10 pipes high, 4 pipes wide, and three coils 3 feet long, 10 pipes high, 4 pipes wide.

In the second story 3 coils 4 ft. long, 12 pipes high, 4 pipes wide.

In the third story 3 coils 4 ft. long, 10 pipes high, 4 pipes wide.

In the fourth story 2 coils 3 ft. long, 10 pipes high, 3 pipes wide.

The piping is done according to No. I. of Baldwin's book, *viz.*: Coils fed by main distributing pipes and main returns, as per diagram enclosed. Now what I wish to know is if I can work the apparatus successfully by carrying same pressure in coils as in the boiler, and return water to the boiler without any trap—I mean the Albany gravitating trap — or must I have a separate return, and bring condensation to the tank and feed it with a pump. As it is now, I bring it to the tank, but water gets so hot that the Hancock Inspirator refuses to work, and I have to discharge condensation in the sewer. In the morning the coils will start well on the first story, on the second slower, third more yet, and so on. When they are all hot, those on the first story will become cold in the lower range of pipe; they are one inch pipe coil made with return bend as shown in sketch, 4 feet long, 12 pipes high and 4 wide.

The main risers are of two-inch pipe on first story, one and one-half inches on second and third, and one and one-fourth on fourth, and main return one and one-half on first and second, one and one-quarter on third, and one on fourth story.

There are 14 coils, some are 3 feet long, 10 pipes high and 3 wide. I have a valve at top of coil, none at return; air cocks at top and bottom; air comes out very slowly. Main pipe is taken from one side of engine pipe with tee. Would it be possible when engine runs that it stop current of steam in coils? Fire is not kept during night. In the morning steam is raised, globe valve open and steam let in the coils. You would oblige me by giving your opinion of the trouble.

I have shown to some of my friends, plumbers, your commandments, and advise them to subscribe for your paper. I am trying the mayor and counsellers to pass a plumbing law here as they have elsewhere.

Yours truly, A. ROUSSEAU.

[You do not say how many "rising lines" you have to the 14 coils, but we assume you have not less than *three*.

If you take a separate 3-inch main pipe from the dome of the boiler, with its own separate valve, and run the pipe as described in Baldwin's book, "System No. 1," it will work without a trap or pump, and as a "gravity system," if the distance between the water line of the boiler and the lowest part of the main is, say not less than 24 inches; but the greater the difference of level the better.

Your horizontal main at any point should not be smaller than 2 inches. It will also be necessary for you to put return valves into the return water pipes at the lower ends of all the coils.

Your main return pipe need not be greater than 2 inches at its largest diameter, and it should have a stop valve close to the boiler, with a "swing" check valve close outside of the stop valve.

The kind of coils you use are a little troublesome with regard to drawing the air off, but we think they will give less trouble when changed to a gravity apparatus.

On page 205 of the book you quote above it, says, "Engine or pump pipes should not be taken from the steam heating pipe, as the draft they cause relieves the pressure in the heating apparatus, etc," and of course it is also meant not to take a steam heating pipe from an engine pipe.

If the cause of the lower ranges of pipes becoming cold cannot be traced to engineer nearly closing or "throttling" the valve *A*, for the purpose of keeping a greater pressure in the boiler or on the engine, then the cause is air which collects from some defect of construction.

If you do change to a gravity apparatus, it must be distinctly borne in mind that the main heating valve on the boiler, and in fact all valves in the heating pipes, must be wide open when the apparatus is in use.

You mention the value *B*, on the return, as opening into the chimney. We cannot understand why you do this, but on general principles we think it is wrong.]

NOTE.—In the illustration the engine is made to look like a pump. It is in reality a steam engine furnishing power.

PLUMBING LAW VIOLATIONS.

Only three reports of violations of the plumbing law were received by the Health Department of this city last week—one from Inspector Hooper and two from Inspector Elliot; both were of a trivial nature.

PHILADELPHIA PLUMBERS.

A meeting of plumbers was held on Feb. 5, in Mount Vernon Hall, 13th and Mount Vernon streets, to make arrangements for forming a protective association. Henry J. Burke presided, and in opening the meeting he stated the objects for which it had been called, one of which was to consider the charge that dealers were selling plumbers' materials to those outside the trade for less than they charged the plumbers.

There was present a committee of seven from the New York Plumbers' Association to assist in organizing the meeting.

A committee of twenty-one was appointed to draft a constitution and a set of by-laws, to be presented at the meeting on Monday evening next.

UNBALANCED BIDS.

A case illustrating the chance for fraud which exists in the ordinary method of letting work by contract to the lowest bidder, is now pending in the Supreme Court in this city.

A small sewer was to be built in the Twenty-third ward. An estimate was made by the assistant engineer in charge of that division, giving the probable quantities of the several items on which proposals were to be based, and by which the bids made were to be compared. This estimate was approved in due course by the Engineer in Chief of the Department of Parks, and the contract was advertised by the Department. Several bids were received. The one which footed up the least was made by the son of the assistant engineer, who made up the estimate of the quantities. This bid was an "unbalanced" or "gambling" bid evidently, for the prices bid for all the items were very low, except for "rock excavation," which was placed at $50 per cubic yard, while other bidders only bid from $5 to $7 per cubic yard for the same, but the quantity of rock excavation being estimated at only 10 cubic yards, the $50 bid was easily balanced by the low prices on the larger items. The law requires that every contract shall be let to the lowest bidder, and the Comptroller and the Park Commissioners could do nothing but award the work to this suspicious bid. But when the sewer was built it was found that there were 297 cubic yards of rock excavation instead of 10, and the contractors final estimate for that item only was $14,850 for work not worth more than $1,500 at the most. This made the work cost the city some $13,000 more than it would if the contract had been awarded to a higher bidder on the first estimate.

The presumption of fraud in this case was so strong, owing to the peculiar relations of the assistant engineer and the successful bidder, that the Chief Engineer very properly took measures in conjunction with the Comptroller to resist the payment of the final estimate due under the contract. The contractor applied to the Supreme Court for a mandamus to compel payment, and Justice Barrett has refused to grant it, which will oblige the contractor to have the whole matter ventilated if he attempts to push his claim.

Now there was nothing inherently wrong in the contractor making such a bid as this if he had reason to believe that the amount of rock as given in the preliminary estimate would be largely exceeded in the execution of the work, provided that he had not received the grounds for his belief from his own father who made the preliminary estimate. Many a reputable contractor has made such bids based on his own judgment of the unseen parts of a work as opposed to that of the engineer, and has made money at it. It is sharp practice, but it is a legitimate business transaction. It is not fair, however, to the city or corporation which has to pay for the work, and its allowance offers great opportunities for fraudulent collusion, as in this case and in the cases of the canal contracts which were ventilated by Governor Tilden a few years ago.

A remedy for the evil has been sought by engineers, but so far no efficient mode of guarding against it has been put into practice. A plan which seemed to promise efficient results was devised a few years ago by the engineer of one of the city departments, who had intended to try it in the next contracts he was to let, but it happened that his head fell into the waste basket while he was preparing the papers, and his successor was afraid to venture on any new experiments until he knew whether his own head was secure on his shoulders. The plan suggested was to enumerate the items and their quantities as usual, and to affix to each a fair price for that class of work, and foot up the total. Then require each bidder to make a proposition to do the work for a gross sum, with the proviso that he should receive as full compensation for each class of work a price bearing the same proportion to the engineer's figures that his gross bid bore to the engineer's total estimate. To illustrate: Suppose that the engineer's estimate of a piece of work was:

100,000 cu. yds. earth excavation	@	$0.15	$15,000
10,000 cu. yds. rock "	@	1.50	15,000
5,000 cu. yds. cut stone masonry	@	22.00	110,000
3,000 cu. yds. rubble masonry	@	6.00	18,000
2,200 cu. yds. concrete	@	5.00	11,000
Total			$169,000

Bidders would be required to name a gross sum. If, for instance, a contractor was satisfied that he could do the work for five per cent. less than the estimated cost, he would bid $160,550. In drawing the contract, the prices

Digitized by Google

of all the items would be scaled down 5 per cent, and would be inserted in the contract thus:

For earth excavation	$0.14¼
For rock "	1.42½
For cut stone	20.90
For rubble	5.70
For concrete	4 75

Now if this work were let in the ordinary way, a contractor who had reason to believe that the rock excavation would turn out to be much greater than was estimated, and that the rubble masonry would be increased, and the cut stone masonry diminished, might bid as follows,

For earth excavation,	100,000 cu. yds.	@ $0.10....	$10,000
For rock,	10,000 cu. yds.	@ 9.00....	90,000
For cut stone,	5,000 cu. yds.	@ 5.00....	15,000
For rubble,	3.000 cu. yds.	@ 11.00....	33,000
For concrete,	2,200 cu. yds.	@ 4.50....	9,900
Total			$157,900

which would make his proposal $2,650 lower than the other man who bid fair prices.

If his surmise was correct, and the quantities were varied as he supposed, the two bids would stand as follows on the final estimate:

		By the fair bid.		*By the unbalanced bid.*	
Earth,	80,000 @	$0.14¼	$11,400	@ $0.10	$8,000
Rock,	30,000 @	1.42½	4,275	@ 9.00	270,000
Cut stone,	2,000 @	20.90	41,800	@ 3.00	6,000
Rubble,	6,000 @	5.70	34,200	@ 11.00	66,000
Concrete,	2,200 @	4.75	10,450	@ 4.50	9,900
Total			$102,125		$359,900

That is to say, the unbalanced bid, which was apparently the lowest, would result in costing the corporation more than three times as much as the fair bid, and would yield the contractor about 280 per cent. clear profits, instead of the fair profit of 25 per cent. This is a very fair specimen of what can be either lost by careless or tricky methods of letting contracts to the lowest bidder, or saved by judicious methods. A competent engineer is as well able to judge of the proportionate prices which should be paid for certain classes of work as a contractor is. In fact, most large contractors now employ engineers to make up their figures for them, and if the proposed plan were put into practice, no attempt at fraud of the kind produced by unbalanced prices attached to erroneous quantities could be made without being sure of immediate detection by the public and all the bidders.

CINCINNATI NOTES.

[From our Special Correspondent.]

Two momentous questions for Cincinnati have at last come up together for settlement, and it is not improbable that she is on the eve of expending millions to obtain a sufficient supply of pure water, and drain properly her large areas of unsewered territory. For this double purpose two bills have been introduced in the Legislature—one to levy a tax of one mill for sewerage purposes and the other to authorize the expenditure of over six millions of the earnings of the water works department to construct pumping works outside of the city limits. Although both these improvements have been regarded as necessities, until within a short time since, the way to accomplish them has not been apparent. The city engineer. Mr. Stanley, has said to the city: "Before you expend millions on a great trunk sewer to carry East Walnut hills' sewerage below the pumping works, consider the propriety of removing the pumping works up the river. Then the eastern hills can find many outlets by natural courses to discharge their sewage into the Ohio, and at half the cost." Then comes Mr. Moore, Superintendent of Water Works, and says officially to the city: "The water works department is in such a flourishing condition that it can take care of six millions of fifteen-forty bonds, which will be sufficient to construct nine miles of 60-inch pipe to Markley farm, together with necessary engines and reservoir." Hence the legislative action. *

[There is no doubt that the present location of the pumping engines at Cincinnati is bad. It was conceded to be so seventeen years ago, when Mr. Kirkwood made his report on the water supply, and recommended the removal of the works. The evil has been increasing ever since, as the city has grown, and the sewage and drainage from a larger area of populated territory has been discharged into the river above the intake of the water works. The theory that the expenditure of six millions of dollars is justifiable because consumers of water are taxed an amount sufficient to pay the interest on that sum, in addition to the cost of maintenance of the works, is not a sound one. There ought to be a certain proportion maintained between the sum contributed by consumers and that contributed by the public at large for the benefits accruing to property from the existence of a good water supply, which enhances values and reduces insurance. When the sum taken from consumers is so large that it suffices not only to pay all expenses, but to afford a revenue to the city and reduce the burden of taxes, it looks as if water rates were too high, and consumers paying more than their share of the public burden. It would be more equitable to so adjust the burdens as to make property pay interest on extensions of the works, and the consumers pay the cost of operation and maintenance.—ED. SAN. ENG.]

Construction Notes.

CINCINNATI.—The contract for the Custom House sewer has been awarded to Messrs. Peters & Scully, at $19,950.

COLUMBUS, O.—A bill is under consideration in the Ohio State Senate authorizing the city to issue $200,000 of bonds to complete the sewers now under construction.

PHILADELPHIA.—The Board of Surveyors have ordered a 28-inch sewer to be built from the one at Preston street and Myrtle, north on Calm st. to Westminster ave. to Holly st., and also that an oval brick sewer of 36 inches capacity be constructed on Twenty-seventh st. from Berks to Columbia ave., and a sewer to extend from Vine to Willow on Second, and one on Phillips from Morris to Berks street.

PRINCETON, N. J.—The Water Company will receive proposals until Feb. 27, for construction of a well, engine house, and boiler house chimney, for foundations of tower, laying water pipes, etc. Plans and specifications can be seen at the office of J. J. R. Croes, C.E., 63 Bleecker st., New York city.

MCKEESPORT, PA.—Proposals for iron truss or suspension bridge, over the Yougheogheny River, will be received by the McKeesport Bridge Company until March 1.

NEW YORK.—The Department of Public Works will receive bids until Feb. 21, for furnishing cast-iron water pipe branches and special castings, and laying mains in uptown streets and avenues. Also for regulating and grading certain designated streets, and laying flagging sidewalks, until same date.

LOWELL, MASS.—The contract for excavating about 225 lineal feet of rock tunnel to lay a sewer in, which is 9 feet 4 inches high by 9 feet wide, was awarded, Feb. 3, to Luther F. Kittredge, of Lowell, at $18.50 per lineal foot.

CHICAGO.—Proposals for street cleaning were opened by the Commissioner of Public Works Feb. 7 as below, and the first named, it is known, will secure the $90,000 contract: John Garrick, $33.49; C. Walsh & Son, $34.90; L. P. Wright & Son, $38.45; C. F. Hotchkiss, $39; Thomas Mackin, $44.

Work snails along on new city hall. Bids are being received by Architect Egan for the sanitary re-plumbing of the North Side County Buildings. Fire escapes are being put on the County Infirmary. The new morgue will be distant at least a mile, instead of only half a block, like the present, from County Hospital. Water works supplying poor house and insane asylum are likely to be built jointly by Cook County, Village of Jefferson and Town of Lake View.

SAVANNAH.—The message of the Mayor of Savannah, Georgia, states that the new five-million-gallon Worthington pumping engine has been running in a satisfactory manner since September 20. The ordinary expenses of the Water Department for the year 1882 were $13,752.65 and the receipts were $35,626.97.

NEW ORLEANS.—The New Orleans, La., *Picayune*, defends the repeal of the ordinance granting the right of sewering part of the city to the New Orleans Sewerage and Drainage Company, on the ground that it would cost the owners and occupants of the 30,000 houses in the district to be drained about $24 per year each, and that "the people cannot afford to indulge in so expensive an improvement in their present debt ridden condition."

PHILADELPHIA.—The architect of the public buildings has sent in to the Commissioners of the Building an estimate of the cost of the marble work yet to be done; he estimates it will require $593,696 to finish the marble work, distributed over the building as follows: the clock-tower $574,000, the court yard $1,820, the western front $1,350, the northern front $16,526. The contract for the entire marble work was awarded to Struthers & Sons, for $5,300,000, and there has been paid to them in all up to the present time, $4,365,275 11.

The streets of Philadelphia are in a fearfully filthy condition, and from present indications there is no hope for releif for some time, at least, of their being cleaned. The amounts of the lowest proposals, of the bids which were opened by the Highway Committee some time ago, was found to be in excess of the appropriation for the work, about $84,000, and in consequence no contracts were awarded for the doing of the work. The Commissioner of Highways, John D. Estabrook, has sent into the Committee on Highways a request that councils shall come to his aid by awarding the $84,000 extra required for the work. The committee, however, think that the specifications should be remodeled so as to reduce the required amount of work to be performed in the suburbs of the city and thus allow the contractors to be able to reduce the amount of their bids.

CINCINNATI.—The Committee on Water Works of the Board of Aldermen resolved the 9th inst. that the propriety of constructing water works at the Markley Farm costing $6,000,000, should be submitted to popular vote before any action was taken.

NEW YORK.—The following bids for furnishing 70 electric lights—including engines, dynamos, conductors, lamps and lamp posts—for the East River Bridge, were annouced by Engineer Martin at the meeting of the trustees on the 12th inst.:

Arnoux-Hochhausen Electric Co	$15,750
United States Illuminating Co	18,150
Schuyler Electric Light Co	20,000
Edison Electric Light Co	21,500
Brush-Swan Electric Light Co	23,273
Fuller Electric Co	25,455

Secretary Brown, presenting his annual report on the Toledo Water Works, says that the use of meters and indicators has greatly checked waste, the consumption in 1882 was 96,000,000 gallons less than in 1881.

The Chief Engineer of the Saratoga Fire Department reported to the Common Council that the water works afforded no protection in case of fire, and the Council requested the water commissioners to resign on account of inefficiency. The Troy *Times*, which is responsible for this statement, does not explain how the inefficiency of the pumping engines is supposed to communicate itself to the water commissioners, or how the resignation of the latter will improve the former.

Some manufacturers on the Blackstone River have applied to the Supreme Court of Massachusetts for an injunction restraining the city of Worcester from taking a portion of its water supply from the head waters of that stream, and thus injuring the water power.

The consumption of water by the people of Milwaukee the past week was 129,649,738 gallons, the largest amount ever consumed in one week by the city.—*Chicago Tribune, Feb.* 3.

The Joint-Sewerage Board of Kensington, on the Thames, England, has asked for an extension of the time allowed them in completing arangements for keeping all sewage out of the Thames. The schemes for irrigation have failed and the Board is now turning its attention to chemical filtration. Great dissatisfaction is felt throughout the district at the time and money expended in fruitless experiments, and some of the local boards are taking steps to deal with their own sewage independently.

SUNDRY AWARDS OF CONTRACTS FOR HARDWARE, ETC.

Custom House and Post Office at St. Louis, Mo. Bids for hardware received under advertisement of January 11, 1883. P. & J. Corbin, $4,641.65; Hopkins & Dickerson, $4,692.58. P. & J. Corbin's bid was accepted.

Custom House and Post Office at Cleveland. Ohio. Proposals for hardware opened at Treasury Department February 3, 1883. P. & J. Corbin $524 59; Hopkins & Dickenson, $538.14. P. & J. Corbin's bid was accepted.

Custom House and Post Office at Cincinnati, Ohio. Bids for fire-proof shutters, etc., under advertisement of November 20, 1882, and reported December 25, 1882, to THE SANITARY ENGINEER and published in No. 4. Vol. 7, dated December 28, 1882. The award has been made to the S. Fire-Proof Shutter Co., for $146,630.00.

Patents.

[*It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, and Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.*]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

265,562. WATER METER AND FILTER. ROBERT C. BARRIE, Philadelphia, Pa., assignor of one-half to John H. W. Chestnut, same place. Filed Dec. 22, 1881. (No model.) Issued Oct. 10, 1882.

Claim.—1. In a water measuring and filtering device, the peculiar shaped inlaid piece of metal D, having inclined surfaces *f* and *g*, in combination with the other connecting and operating parts, as and for the purpose shown and described.

2. In a water meter, the cylinder A, piston C, and inlaid piece of metal D, having inclined surfaces *f* and *g*, in combination with the rod B and suitable connecting parts with the spring L, all arranged and operating together substantially as herein set forth and described.

3. In a water filtering device, the filtering chambers *p p* and sieves E, in combination with the cylinder A, piston C, inclined surfaces *f f g g*, rod B, and the connections with the spring L, all operating substantially in the manner and for the purpose shown and described.

4. In a meter and filter, the combination of the valve F, the rod *r*, weight *s*, flexible ball *i*, tube or pipe *j*, and air chamber *k* with the waste pipe *h* and supply pipe *b*, as and for the purpose set forth.

265,600. SEDIMENT TRAP. LORING P. HAWES, New York, N. Y. Filed April 17, 1882. (No model.) Issued Oct. 10, 1882.

Claim.—In a sediment trap for pipes, the combination of a pipe coupling and a sediment chamber, provided with a discharging outlet, controlled by a valve or plug, with a transverse bar extending across the lower portion of the direct passage through the pipe coupling, and adapted for the passage of a diminished current under the bar and across the upper end of the sediment chamber, substantially as described.

265,624. MACHINE FOR TAPPING MAINS. HIERONYMUS MUELLER, Decatur, Ill. Filed Jan. 10, 1882. (No model.) Issued October 10, 1882.

Claim.—1. In a machine for tapping water or gas mains while under pressure, an indirect communication between the upper and lower chambers independent of the valve D, said communication being controlled by a screw, P, as shown, for the purpose of equalizing the pressure in the upper and lower chambers when the valve D is closed, as specified.

2. In a machine for tapping water and gas mains while under pressure, the yoke S, having tangs, *s s*, provided with dogs, s^1 s^1, adapted to engage with the feeding-nut I by hooking into the oblong slots *i*, its upper part having slot *t*, which fits on the drilling-rod G between the collars *a a*, substantially as set forth.

3. In a machine for tapping water and gas mains, the combination of the swinging valve, the frame of which has the enlargements *d'* and oblong hole d^1, and the transverse shaft, from which the valve is suspended within the lower chamber, jointly with the soft-rubber disk d^2, secured to the upper surface of the valve by a metallic washer and screw, substantially as and for the purpose described.

4. In a machine for tapping water and gas mains while under pressure, the valve D, constructed as described, and suspended within the lower chamber, substantially as set forth, jointly with an indirect channel between the upper and lower chambers, through the projection or lug O, for the purpose of equalizing the pressure above and below the swinging valve, so as to facilitate its operation, said channel being controlled by a screw, P, substantially as and for the purpose set forth.

265,636. VENTILATOR. RUFUS S. READ, Philadelphia, Pa. Filed Mar. 20, 1882. (No model.) Issued October 10, 1882.

Claim.—1. The combination in a window-ventilator, of the oblong bar B, provided with oblique parellel ends *b* b^1, air-opening and wire-gauze D, curved through A, hinged cover C, and spring S, substantially as shown and described.

2. The combination of the adjustable plate G, slots *e* e^1, set-screws H H, air-openings and wire-gauze D^1 D^2, and cover E with the upper or meeting rail of the lower sash, substantially as shown and described.

265,653. STATIONARY WASH-BOWL. WILLIAM BLACKWOOD, Jr., Detroit, Mich. Filed Feb. 4, 1882. (No model.) Issued October 10, 1882.

Brief.—In an offset of the bowl is a recess, *a*, for soap, which recess at top is covered by the top of the stationary wash-stand.

Claim.—1. A stationary wash-bowl provided with an offset having a recess, the front of which is protected by a ledge, and leading from which are one or more apertures, substantially as and for the purposes described.

2. The combination of the stationary wash-bowl provided with a soap-receptacle, herein described, with a stationary wash-stand, the marble top of which forms the top of the recess in the bowl, substantially as specified.

265,681. PACKING FOR PIPE-JOINTS. ORANGE M. LOVERIDGE, Weaverville, Cal. Filed July 31, 1882. (No model.) Issued October 10, 1882.

Claim.—A packing for pipe-joints, consisting of the metal ring or band C, secured within the end of a pipe, the metal ring or band D, and the intervening leather or flexible packing-ring, E, both of which are secured to ring C by bolts F, and extended beyond the end of the pipe, the flexible ring being turned down upon the outer surface of D, and the whole inserted within the enlarged end of another pipe, and operating substantially as herein described.

265,697. STEAM HEATING APPARATUS. EUGENE F. OSBORNE, St. Paul, Minn. Filed May 29, 1882. (No model.) Issued October 10, 1882.

Claim.—In combination with a steam heating apparatus comprising a pipe for the return of the water of condensation to the source of steam-supply, two steam-generators carrying different pressures and constituting such source of steam-supply, an engine connected between said generators so as to run by the difference in their pressures, and a pump and connections for returning the water of condensation to both generators, substantially as described.

265,802. COMBINED HEATER AND VENTILATOR. MATHIAS HECKEL, St. Louis, Mo. Filed Aug. 23, 1882. Issued Oct. 10, 1882. (No model.)

Claim.—1. In combination, the stove A, the escape-pipe M, having a lower extension provided with an open bell-mouth N, and damper O, and upper pipe. P, having open bell-mouth, Q, and damper, R, all substantially as shown and described, for the purpose set forth.

2. In combination with the stove A, the escape-pipe M, consisting of two portions connected by duplicate sections V V^1 and lengths of pipes V^2 V^6, the interior of the inner pipe communicating with the outer air by openings V^7 in the sections V V^1, substantially as shown and described, for the purpose set forth.

3. The combination of stove A, provided with diaphragm C, inclosing case D, provided with openings G at top and F at bottom, and escape-pipe M, made in two portions, connected by sections V V^1 and pipes V^2 V^5, and having a lower extension, with an open mouth N, and damper O, and an upper pipe P, with open mouth Q, and a damper R, secured to a rod S, and operated by a bell-crank lever U, all substantially as shown and described, for the purpose set forth.

265,810. ELECTRIC LAMP. DANIEL N. HURLBUT, Chicago, Ill. Filed Jan. 28, 1882. Issued Oct. 10, 1882. (No model.)

265,814. VENTILATOR OR CHIMNEY-CAP. JOHN H IRWIN, Morton, Pa. Filed April 24, 1882. Issued Oct. 10, 1882 (No model.)

Claim.—1. A ventilator or chimney-cap formed of cast-metal plates, as set forth, bearing wings or arms upon their upper surfaces, the upper edges whereof adapted and arranged to fit within grooves formed in the under side of the plate above, said plates being held in place and secured to a section of pipe or the chimney-top, substantially as shown and described.

2. In a ventilator or chimney-cap, pipe A, wherein are located eyes B, said pipe bearing annular plate A^1, having wings or arms *a*, plate A^2, having grooves therein or projecting studs thereon, as specified, and being provided with wings or arms *a*, plate A^3, and bolts or screws C, the whole combined and arranged substantially as shown and described.

3. In a ventilator or chimney-cap, pipe A, whereon is formed a rib, D, extending thereabove and from side to side, substantially as shown and described.

260,070. PUMP. SAMUEL S. ANDREWS, Knoxville, Iowa. Filed July 8, 1882. (No model.) Issued October 17, 1882.

265,607. PUMP. PIERRE E. JAY, New York, N. Y. Filed July 12, 1882. (No model.) Issued October 10, 1882.

265,621. WIRE-SUPPORT FOR UNDERGROUND CONDUITS. ALBERT H. MERSHON, Philadelphia, Pa., assignor to the Morse Underground Conduit Company of New Jersey. Filed Jan. 26, 1882. (No model.) Issued October 10, 1882.

265,630. APPARATUS FOR RAISING WATER THROUGH SYPHON-PIPES. JOHN PATTEN, San Francisco, Cal. Filed June 13, 1881. (No model.) Issued October 10, 1882.

265,657. STEAM PUMPING-ENGINE. GEORGE M. CONWAY, Wilwaukee, Wis. Filed December 27, 1881. (No model.) Issued October 10, 1882.

256,670. ELECTRIC-ARC LAMP. JOHN H. GUEST, Brooklyn N. Y. Filed June 22, 1882. (No model.) Issued October 10, 1882.

265,691. PUMP. LOUIS C. MILLER, St. Louis, Mo. Filed Jan. 28, 1882. (No model.) Issued October 10, 1882.

265,698. METER FOR STEAM HEATING APPARATUS. EUGENE F. OSBORNE, St. Paul, Minn. Filed June 27, 1881. (No model.) Issued October 10, 1882.

265,787. ELECTRIC LAMP. GEORGE W. BEARDSLEE, Brooklyn, N. Y., assignor to William F. Jobbins, East Orange, N. J. Filed June 15, 1881. Issued Oct. 10, 1882. (No model.)

265,775. ELECTRIC-ARC LIGHT. THOMAS A. EDSON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York. N. Y. Filed Nov. 28, 1882. Renewed Aug. 14, 1882. Issued Oct. 10, 1882. (No model.)

265,776. ELECTRIC-LIGHTING SYSTEM. THOMAS A. EDSON, Menlo Park, N. J., assignor to the Edison Electric Company, New York, N. Y. Filed Nov. 11, 1882. Issued Oct. 10, 1882. (No model.)

265,781. REGULATORS FOR DYNAMO-ELECTRIC MACHINES. THOMAS A. EDSON, Menlo Park, N. J. Filed Aug. 7, 1882. Issued Oct. 10, 1882. (No model.)

265,784. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. THOMAS A. EDSON, Menlo Park, N. J. Filed Aug. 14, 1882. Issued Oct. 10, 1882. (No model.)

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

For the week ending Feb. 4, in 31 U. S. cities, having an aggregate population of 5,909,012, there died 2,468 persons, giving a mortality equivalent to an annual death rate of 21.7 per 1,000. In the North Atlantic cities the rate was 21.8; in the Eastern cities, 22.6; in the Lake cities, 16.7; in the River cities, 19.9; and in the Southern cities, for the whites, 19,5, and for the colored, 33.4 per 1,000.

Deaths from small-pox are reported in Providence, Philadelphia, Wilmington, Pittsburgh, Louisville, Indianapolis, Minneapolis, St. Paul, District of Columbia and Nashville. The mortality from acute lung diseases continues high.

SANDWICH, ILL.—Dr. Ballou reports the prevalence of scarlet fever of a mild form.

LOUISVILLE, KY.—The weekly report shows five deaths from small-pox. Health Officer Montgomery considers the disease as under control.

PITTSBURGH, PA.—Dr. Snively reports one new case of small-pox during the week.

PROVIDENCE, R. I.—The death from small-pox given in the table is that of the patient reported last week as having come by sea from Baltimore, Md.

BOSTON, MASS.—C. E. Davis, Jr., reports 33 cases of diphtheria, 28 of scarlet fever, and three of typhoid fever.

MILWAUKEE, WIS.—Dr. E. W. Diercks reports 17 new cases of scarlet fever and six of diphtheria.

DETROIT, MICH.—Dr. O. W. Wight reports 25 cases of diphtheria, and 21 of scarlet fever.

NEW YORK CITY LUNATIC ASYLUM.—Dr. Franklin reports 13 admissions, one discharge, two deaths, and 1,325 insane patients remaining under treatment.

MOLINE, ILL.—Dr. Dunn reports the cases of small-pox under treatment in the hospital as doing well, and considers the disease as suppressed.

Digitized by Google

ROCK ISLAND, ILL.—Dr. G. G. Craig reports four deaths during the week. Consumption, pneumonia, congestion of lungs, and acute bronchitis one each.

BALTIMORE, MD.—During the week ending Feb. 3, there were 230 deaths: males 108, females 122; under five years 94, over 60 years, 31. The annual death rate is given as 29.24 for the whole population—25.18 for the whites, and 52.86 for the colored. Small-pox caused 69 deaths, accidents four, croup three, consumption 25, diphtheria 16, erysipelas three, typhoid fever three, malarial fever one, scarlet fever seven, bronchitis six, pleurisy one, pneumonia ten, and measles one. The births reported numbered 214.

HARRISBURG, PA.—During the month of January there were 32 interments. Diphtheria caused three of the deaths, consumption three, and pneumonia two. Four of the interments were of still-born children.

MICHIGAN.—During the week ending Jan. 27, the prevailing diseases as reported by Dr. H. B. Baker were in order of prevalence as follows:—neuralgia, bronchitis, tonsillitis, rheumatism, consumption, influenza, pneumonia, and erysipelas. "The reports show that, with the extreme low temperature and the considerable increase in ozone, there was a marked increase in the area of prevalence of erysipelas, influenza and pneumonia. Neuralgia, tonsillitis, diphtheria and bronchitis also increased in area of prevalence. There was no marked decrease in any disease reported. The correspondent at East Tawas reports the prevalence of a disease in his locality that first attacks the tonsils, then the pharynx, larynx and trachea, and sometimes the œsophagus, with enlargement of the glands of the neck, and suppuration in the ears. The health officer of the township of Crockery, Ottawa Co., reports the prevalence of sickness beginning with chills followed by fever, lasting from one to four days, with inflammation of the tonsils and throat. He also reports many cases of *winter cholera*, which comes on very suddenly and is severe."

Scarlet fever was reported at 19 places, diphtheria at 25 places, measles at nine places, and small-pox at one place, St. Joseph, Berrien Co.

DAYTON, OHIO.—The report for the week ending Jan. 27, shows a total mortality of nine, of which three are recorded as under five years. One death from each of the following causes is reported: consumption, diphtheria, pneumonia and small-pox.

HUDSON CO., N. J.—The report for the week ending Jan. 27 came too late to appear in our last week's issue. Total deaths 103; under five years 50; accidents three, cerebro-spinal meningitis one, consumption 15, croup four, diarrhœal diseases one, diphtheria six, malarial fever one, scarlet fever four, pneumonia 13, congestion of lungs one, bronchitis nine, and puerperal diseases three.

PITTSBURGH, PA.—Annual report for the year 1882. Dr. Snively, the Registrar of the city, transmits a copy of this report. The total number of deaths was 4,090 equal to a death rate of 24.0 per 1,000 (estimated population 170,000). There were 1,020 deaths of infants under one year, and 866 of children between one and five, making 46 per cent. of the total mortality. The deaths of persons over 60 years numbered 478. A report is given of the cases and fatality of infectious diseases, but, except with respect to small-pox, the cases reported do not embrace all that really occurred. There only seven cases of whooping cough were reported, while 96 deaths were recorded from this disease. Measles, 854 cases and 91 deaths; diphtheria 554 cases and 185 deaths; small-pox 1,136 cases and 300 deaths; scarlet fever, 234 cases and 63 deaths; typhoid fever, 1,782 cases and 268 deaths; cerebro-spinal fever, 56 cases and 34 deaths; other diseases of this class, three cases and 35 deaths. Total, 4,626 cases and 1,072 deaths. Measles prevailed most extensively in the spring, whooping cough in the summer, diphtheria and typhoid fever in the autumn and small-pox and scarlet fever in the winter months.

Consumption caused 316 deaths, pneumonia 306, bronchitis 106, diarrhœal diseases 375 and violence 333.

ONTARIO, CANADA.—The Provincial Bulletin for the week ending Jan. 27 says that, "In spite of the excessively cold and unusually severe weather of last week the report does not show any very extreme change in respect to any particular disease. This is due largely to the fact that diseases of the respiratory organs had in previous reports

(Continued on page 254.)

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

Wholesale Agents for U. S. and Canada,

NEW YORK.

Pure Sugar

vs.

Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

HAVEMEYERS & ELDER.

DECASTRO & DONNER REFINING CO.

117 WALL STREET,

NEW YORK.

A SOUND POLICY.

PURE SPICES ONLY.

Some manufacturers and dealers allege that it is necessary to give a large weight or bulk for a certain amount of money, hence the admixture of many worthless, if not hurtful, compounds. Now we do not believe in this argument, and while there may be some demand for "a big package for a small amount of money," we rate the intelligence of the American people too high to believe that they prefer to have half a pound of adulterated spice instead of a quarter of a pound of pure spice containing the same strength. As well might the consumer prefer a quart of water mixed with an equal quantity of milk at a higher price for the two quarts of mixture than for the one quart of milk. We therefore put up

PURE SPICES ONLY,

and leave it to others to furnish adulterated spices, if any are required. We some time since dropped from our list the Griswold's O K and I X L brands, retaining the "*Thurber's S. I.*," and "*Massasoit Mills*" brands, the former being an extra grade of the finest, freshest and strongest spices, especially Selected and Imported, hence the brand (S. I.), for the finest trade; while the "*Massasoit*" brand will represent strictly pure goods of good quality. Both of these brands will be put up *full weight*, thus heading off another swindle frequently perpetrated upon the consumer, and to meet the demand which may legitimately exist for a package of spice for a small amount of money, we have concluded to put up, in addition to the larger size, *a two-ounce round tin, with sifting top*, which we guarantee contains more real value than the usual four-ounce tin of adulterated spices, the only condition necessary in the use of pure spices being to use less of them.

We expect that consumers will, and, indeed, they have, sustained us in taking this stand. Reputable dealers prefer to sell only full weight and genuine goods. Competition from the unscrupulous sometimes induces them to keep good, bad, and indifferent. We rely on the intelligence of consumers to encourage them to keep first-class articles. Ask therefore for

Thurber's S. I. Spices.

They are put up in two, four, eight and sixteen-ounce tins. *Always full weight.*

Digitized by Google

already occupied a very high position. Thus bronchitis, influenza, tonsilitis, along with neuralgia and rheumatism, are still the prominent diseases. Among the peculiar features of this extremely cold week is the fact that in district IV, whence are reported over 700 cases of disease, diarrhœa not only becomes one of the six most prevalent diseases, but it amounts to five per cent. of all the diseases reported. Extreme cold as well as extreme heat would seem to have the same tendency; but while we must suppose that the former acts while producing internal congestions, the latter induces the disorder by the irritative effects of fermentative changes.

ENGLAND.—The annual mortality rate for the week ending Jan. 20, in the 28 great towns of England and Wales, averaged 23,4, Cardiff having the lowest rate, 13.9, and Manchester the highest, 31.4. The 22 deaths from diphtheria in the 28 towns included 13 in London and three in Liverpool. Small-pox caused three deaths in London, two in New Castle-upon-Tyne, one in Nottingham, and one in Derby.

London.—Births, 2,804; deaths, 1,663. The births exceeded by 28, whereas the deaths were 185 below the average numbers in the corresponding weeks of the last ten years. The annual rate was 21.9. Small-pox caused three deaths, measles 56, scarlet fever 42, diphtheria 13, whooping cough 26, typhoid fever 18, diarrhœa and dysentery 18. The deaths from diseases of the respiratory organs, which had steadily declined in the five preceding weeks from 637 to 361, were 389 during this week, or 130 below the corrected weekly average.

SCOTLAND.—The Registrar-General's return for the week ending Jan. 20, shows a death rate of 26.8 in the eight principal towns, which is 4.7 above that of the corresponding week of last year. The lowest and highest rates were recorded in Perth and Paisley, 17.0 and 30.8, respectively. The births numbered 868; for summary of deaths, see table given above.

PARIS, FRANCE.—There were 1,351 births and 1,135 deaths in Paris during the week ending Jan. 18. Of the decedents 600 were males and 535 females; 282 under five years and 258 over 60 years. Typhoid fever caused 68 deaths, small-pox 15. measles 14, scarlet fever four, whooping cough six, croup and diphtheria 37, erysipelas five, puerperal diseases five, consumption 203, bronchitis 35, pneumonia 93, and violence 31. On Jan. 14 there remained under treatment in the hospitals 75 cases of small-pox, 631 cases of typhoid fever, and 29 cases of diphtheria.

During the month of November there were 8,962 cases of diseases treated by *l'Assistance publique*, of which 7,881 ended in recovery and 1,081 in death. The numbers given below refer to recoveries and deaths respectively: Typhoid fever, 1,672, 191; small-pox, 51, 18; measles, 16, five; scarlet fever, 10, none; whooping cough, two, one; diphtheria and croup, 34, 55; acute bronchitis, 209, 26; pleurisy, 86, 22; pneumonia, 94, 51; pulmonary congestion, seven, seven; erysipelas, 79, 10.

HAVRE, FRANCE.—The Bulletin for the week ending Jan. 13 shows 76 births and 68 deaths as having occurred. Of the decedents 34 were males and the same number females; under five years 25, over 60 years eight. Small-pox caused one death, typhoid fever three, croup and diphtheria ten, consumption 19, bronchitis and pneumonia two. No deaths were recorded from measles, scarlet fever, whooping cough or puerperal fever.

RHEIMS, FRANCE.—Consul John L. Frisbie transmits the report for the week ending Jan. 13. Total deaths 43, under five years 15, over 60 years 14. Rate 23.83. Croup caused two deaths, acute bronchitis two, bronchial catarrh three, pneumonia two, consumption three and violence three. No deaths are reported from small-pox, measles, whooping cough, erysipelas, typhoid, scarlet or puerperal fevers.

BRUSSELS, BELGIUM.—During the week ending Jan. 13 there were 280 births and 204 deaths in the city and its suburbs, giving respectively the annual rates of 35.7 and 26.5 per 1,000. Deaths of persons under five years 89. Small-pox, measles, whooping cough and typhoid fever caused four deaths each, scarlet fever and diphtheria none, croup one, diarrhæa and dysentery 20, bronchitis and pneumonia 33, and consumption 28.

The Bulletin for the fourth quarter of the year 1882 shows a total of 3,509 births, males 1,818, females 1,591, corresponding to an annual rate of 34.5. Still births 211, deaths 2,096, males 1,087, females 1,009; under five years 801, over 60 years 479. Annual rate 20.6. Small-pox caused 28 deaths, measles seven, scarlet fever six, typhoid fever 30, croup 30, diphtheria four, whooping cough ten, puerperal diseases 24, bronchitis and pneumonia 312, diarrhœa and dysentery 232, consumption 303 and violence 58.

COPENHAGEN, DENMARK.—There were 107 deaths during the week ending Jan. 9; under five years 50, over 60 years 20. No deaths were reported from small-pox, measles, or whooping cough. Scarlet fever caused one death, diptheria and croup four, diarrhœa six, puerperal fever two, and typhoid fever one, consumption nine, pneumonia nine, pleurisy one, and bronchitis eight.

The cases reported were as follow: Small-pox one, measles six, scarlet fever 35, diphtheria 16, croup seven, whooping cough 45, typhoid fever five, diarrhœa 98, erysipelas 25, bronchial catarrh 476, pneumonia 67, and tonsillitis 135.

MILAN, ITALY.—Consul Dunham J. Crain reports 783 deaths for the month of November, 41 of which were caused by typhoid fever and 18 by diphtheria. Of the latter disease 31 cases were reported as compared with 15 cases (eight of which were fatal) during the previous month. Mr. Crain remarks that the city is exceptionally free from winds and is, on that account, regarded as favorable for consumptives. The population is estimated at 320,292.

VIENNA, AUSTRIA.—Consul-General Weaver reports 397 deaths for the week ending Jan. 13, 106 of which were caused by consumption, 70 by acute lung disease, three by small-pox, two by scarlet fever, five by diphtheria, one by whooping cough, one by typhoid and four by typhus fever. Deaths under five years 139. Death rate 27.5.

STOCKHOLM, SWEDEN.—Consul Elfwing transmits the report for the week ending Jan. 6. Total deaths 92; males 43, females 49; under five years 45, over 60 years 16. Measles caused five deaths, scarlet fever one, whooping cough three, diphtheria six, typhoid fever one, consumption 11, pneumonia 19, bronchitis nine, and violence one Looking at the number of cases reported bronchitis, measles and scarlet fever are the prevailing diseases.

SMYRNA, TURKEY.—Consul W. E. Stevens reports under date Jan. 15 that he has just received official information that the quarantine established against the province of Hedjaz, in which is situated the town of Mecca, has been raised, the cholera having subsided.

Mr. Stevens reports also that the small-pox has ceased to be epidemic in Smyrna, the disease having yielded to preventive measures and vaccination. A few cases continue under treatment in the hospitals.

CALCUTTA, BRITISH INDIA.—Consul-General Mattson transmits reports for the weeks ending December 16 and 23.

December 16. Total deaths 383, giving an annual rate per 1,000 of 46.1 as compared with 41.4 in the previous week. The cholera mortality is very high, 107 deaths having occurred from this cause. The northern sections and suburbs are mainly affected. Fever caused 95 deaths, diarrhœal diseases 48, tetanus 31 and consumption seven.

December 23. Total deaths 359. Annual rate 43.2. Cholera abating somewhat, but still high, the deaths numbering 97. Fever caused 91 deaths, diarrhœal diseases 50, tetanus 22 and consumption nine.

SHANGHAI, CHINA.—Vice-Consul-General F. D. Cheshire reports that during the weeks ending Dec. 26 and Jan. 2, a few cases of small-pox occurred among the foreign population.

BOMBAY, INDIA.—Consul B. F. Farnham transmits report for the week ending Jan. 2. Deaths 429, being 59 less than the mean of the corresponding period in the previous five years. Annual rate 27.37. Remittent fever caused 85 deaths, cholera one, acute diseases of the respiratory system 65, diarrhœa 23 and dysentery six. The births reported during the week numbered 326.

ST. PAUL DE LOANDA, AFRICA.—The small-pox epidemic is abating. During the month of November 21 cases were reported, of which nine were fatal.

QUARTERLY MEETING OF THE STATE BOARD OF HEALTH.

The State Board of Health of this State held their quarterly meeting in Albany, Feb. 6, Hon. Erastus Brooks presiding. Attorney-General Russell submitted facts pointing to the necessity of investigating the nuisances connected with the petroleum refineries on the New Jersey shore of the Kill Von Kull. The Board ordered the necessary inspection. The Standard Oil Company agrees to comply with the recommendations of the Board's Inspector.

The Board discussed the general drainage law of 1869, and the recommendations on the subject were referred to the Attorney General to be put in shape to be laid before the legislature.

PARASITES IN PORK IN MONTREAL.

Dr. Wm. Osler, assisted by A. W. Clement, has published, in the Canada *Medical and Surgical Journal* for January, 1883, the results of an examination made by them of the carcasses of one thousand hogs slaughtered in Montreal, chiefly at the Dominion Abattoir during the past eight months. No selection was made, the carcasses being taken indiscriminately, as found at the time of visit. All the animals examined were from Western Canada. In four of them the trichina spiralis was found. This proportion, viz.: 1 in 250, is low, as compared with that obtained by Mr. Billings, in Boston, viz.: from 1 in 17, to 1 in 44, or with that found in a series examined a few years ago in Chicago, viz.: 1 in 49.8.

Of 1,037 hogs examined, 76 were infested with the cysticercus or measle, the cause of tape-worm in man, giving a proportion of 1 in 13.6.

The following are the conclusions of the paper:

"1. The investigation shows that the hogs slaughtered for our markets, present parasites in numbers sufficient to necessitate a more thorough inspection than is at present carried out.

"2. As regards trichina spiralis, which was found in the proportion of 1 to 250, we are of opinion that, considering the extreme rarity of cases of trichinosis, and the difficulties attendant upon a systematic inspection, a compulsory microscopic examination of the flesh of every hog killed, is not at present called for.

"3. In the case of 'measles' the liver should be carefully examined, and if present in it, the flesh of the animal should receive the special attention of the inspector; if only in the liver, the entire carcass need not be confiscated.

"4. Echinococcus cysts in the liver, render that organ unfit for food, but in other parts, unless very numerous and disorganizing, they may be cut out, and the carcass remain marketable.

"5. The public should be made aware of the possible dangers of eating in any form, raw, or partially cooked meat. The best safeguard against parasitic affections, is not so much inspection of the flesh, unless, indeed, this is minutely carried out, as careful attention to culinary details.

"6. To reduce the number of infested hogs, great attention should be paid to their hygenic surroundings, particularly in the matter of feeding. The danger is not during the period when the animals are penned and fed on grain, etc., but when they are allowed to roam at large, and feed indiscriminately."

Martin's *Chemist's and Druggist's Bulletin* will be issued after issued as a semi-monthly journal, under the title of *Pharmaceutical Record*, with Mr. P. N. Bedford, who has been for some time editor of the *Bulletin*, manager and editor. The first number presents a neat appearance, has strong backing, and is devoted to the interests of pharmacists, which its editor is qualified by special training to well serve.

In Pennsylvania, on the 26th ult., a resolution was introduced in the House, to investigate the pollution of rivers of the State. Also to establish a State Board of Health for protection of life and to prevent spread of contagious and infectious diseases.

It is becoming quite common now in Cincinnati, in making house connections with sewers, to have water closet vaults or new receptacles beneath the pavements. They have a valve through which they may be flushed and discharged into the sewers. There are several patents in use.

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

Proposals.

PRINCETON WATER WORKS.

OFFICE OF THE PRINCETON WATER COMPANY, PRINCETON, N. J., *Feb.* 10, 1883.

Proposals will be received at this office until noon of Tuesday, February 27, 1883, for the construction of a well, engine-house and boiler-house and chimney and for foundations for a tower, and for laying water pipes and appurtenances for the Princeton Water Company, in accordance with the plans and specifications for the same on file in this office. All proposals must be itemized in accordance with the plans and specifications for the same on file in this office. All proposals must be itemized in accondance with the classification prescribed by the Company, and no proposal for doing the work for a gross sum, irrespective of items, will be considered. The Company reserves the right to reject any or all proposals if they are not satisfactory. The plans and specifications may be seen and blank forms of proposals procured at this office, and also at the office of the engineer, J. J. R. Croes, C. E., 63 Bleecker street, New York City. Any person to whom a contract may be awarded will be required to execute a bond with satisfactory security for the amount of 50 per cent. of the estimated cost of the work. The work is to be begun at once, and completed by July 1, 1883.

WILLIAM LIBBEY, Jr.,
Secretary Princeton Water Co.

PROPOSALS FOR BUILDING A STEAM PROPELLER FOR THE QUARTERMASTER'S DEPARTMENT.

DEPOT QUARTERMASTER'S OFFICE, CORNER HOUSTON AND GREENE STS., NEW YORK CITY, *Feb.* 5, 1883.

Sealed proposals, in triplicate, with a copy of this advertisement attached to each, are invited, and will be received at this office until 12 M., March 7, 1883, at which time they will be opened in the presence of bidders, for the construction of a steam propeller for the United States Quartermaster's Department, for service at Fort Monroe, Virginia. Bids are invited to be made for the vessel complete; also for that portion embraced in specifications No. 1, or that in No. 2, or that in No. 3, only, or those portions in any two of them. Plans and specifications of the same, together with all other necessary information, will be furnished to bidders on application to the Chief Quartermaster on Governor's Island, New York Harbor, the Depot Quartermasters at Washington, Baltimore, Philadelphia and Boston, the Post Quartermaster at Fort Monroe, Virginia, and at this office. Bids are also invited for the work on the basis of supplying out-board condenser, 6-inch, No. 8 copper, or ¼ brass. Also on the basis of the Government supplying the circulating and air pump, and a condenser of one-half the required capacity, the contractor furnishing the other half and making all connections. In either case, if award is made thereon, the specifiations will be changed accordingly. The right is reserved, on the part of the United States, to reject any or all bids. Proposals should be endorsed "Proposals for Construction of Steam Propeller," and addressed to the undersigned.

HENRY C. HODGES,
Deputy Quartermaster-General, United States Army.

PROPOSALS FOR HARDWARE.

OFFICE OF SUPERVISING ARCHITECT, TREASURY DEPARTMENT WASHINGTON, D. C., *Feb.* 5, 1883.

Sewers and Drains FOR Populous Districts;

With Rules and Formulæ for the Determination of their Dimensions under all Circumstances.

BY JULIUS W. ADAMS,

Chief-Engineer to the Board of City Works, and Consulting Engineer to the Board of Health, Brooklyn.

Illustrated with a Colored Map and numerous Engravings.

Octavo; 228 pages. Price, $2.50

This is a well printed octavo, from the pen of one of the best authorities of our day, and is well worthy of a place in the library of every city engineer and Board of Health in the community. The large experience of Mr. Adams as Chief-Engineer of the City of Brooklyn during the development of her elaborate system of water supply and sewerage has enabled him to present in a compact and terse manner all the leading facts and considerations which govern the construction of Sewers in most of our cities.

D. VAN NOSTRAND, Publisher,
23 Murray and 27 Warren Streets, New York.

"THE DU BOIS" TRAPS.

These Celebrated Traps are made in the same way as lead pipe—Sound and Smooth, Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

The "National" Patent Side Outlet Closet and Trap.

WITH IMPROVED FLUSH. (Registered).

Made either complete in one piece of Earthenware, or in two pieces with Basin and Trap separate.

An important alteration has been made in the *flushing* arrangement of this closet. The *supply* is now placed *opposite* the *outlet*, and a *new registered fan* attached which makes the closet more effective, and with less than two gallons of water it is guaranteed to perfectly flush out the soil and thoroughly wash the inside of basin.

The Most Cleanly, Durable, Effective and Cheapest Closet and Trap ever used, requires no fittings nor Machinery of any kind, and cannot get out of order.

For the perfect working of this closet a supply pipe not less than 1¼ inch must be used.

MANUFACTURED BY THOS. TWYFORD, HANLEY, STAFFORDSHIRE, ENG.

Sole Agent for the Manufacturer, E. ASPINALL, 206 Pearl Street, New York.

PLUMBERS' AND SANITARY EARTHENWARE OF ALL DESCRIPTIONS.

Illustrated Catalogue and Prices Furnished the Trade on Application.

THE BELL WATERPHONE COMPANY.

Sole Proprietors of the Invention for the Prevention of the Waste of Water, and the Discovery of Leaks in Water Craft and the Detection of Defects in Mechanical Movements.

It is specially adapted to the use of Plumbers and for Water Works.

—

Address,

Thos. J. Bell,

MANUFACTURERS OF
IRON SOIL PIPE AND PIPE FITTINGS,
BOILER STANDS, SINKS, BATH TUBS, AND A FULL LINE OF PLUMBERS' IRON WARE.
EXTRA HEAVY PIPE and FITTINGS A SPECIALTY.

TWO years ago the undersigned introduced to the trade in this country THE ROYAL PORCELAIN BATH.

Prior to that period it was little known, except to those Americans who may have seen them when traveling in Great Britain; while it is true that they had been used there for 25 years, and were universally conceded to be the finest thing in the way of a Bath Tub known, yet, like all things supposed to be new and of high cost, they required extensive advertising to secure their acceptance and use to any considerable extent in the United States.

The effect of numerous expressions of opinion, made without either knowledge or experience to justify them as to their durability and utility, had to be counteracted, yet, as a result, we have succeeded in having them selected for some of the most elegant residences that have been erected within the past ten years. They have also been used in several hospitals, for which places we make a special, less elaborate, and cheaper class of fittings.

A personal inspection will convince any one of their superiority. Their increased cost over that of an ordinary copper-lined bath tub should not be a consideration to those who can afford to live in a house worth over $15,000, and would not be if their cleanliness, inviting appearance and durability was appreciated.

MEYER, SNIFFEN & CO.

46 & 48 Cliff Street,
New York.

N. B.—We have imported a line of sinks, which are made of the same non-absorbent material as the ROYAL PORCELAIN BATH TUBS. They are admirable for Hospitals. They have been used in some of our elegant New York residences, where their expense was no objection. They are one and one-half inches thick, and are less likely to be broken than cast iron. We have a size in stock that would make an admirable "Foot Bath."

The "EUREKA" Wheel

Pipe-Cutter.

☞ If the House of whom you purchase your supplies does not keep it, send direct to us.

The Body—is fitted with an adjustable Cast-Steel Jaw at the point where it comes in contact with the Pipe, which Jaw can be renewed at any time by simply removing one screw. By this system the wearing away of the Jaw (which is other cutters is the first part to give out) is effectually prevented, and this tool can be kept in first-class order at all times.

The Wheel Block—This is also of Cast-Steel, neatly fitted to its socket *and cannot be dropped out.* It is much more durable than the cast-iron blocks and is hardened at the point where the rod comes in contact with it.

The Handle—of this Cutter *is put on to stay*, and cannot be removed by the roughest usage, as it is a hollow iron handle, *cast fast to the Rod*, operating the block.

Manufactured by PANCOAST & MAULE, 243 and 245 South Third Street
PHILADELPHIA, PA.

Over 100,000 *now in use!*

JENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

INSIDE VIEW OF GATE VALVE.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

READERS WILL CONFER A FAVOR BY MENTIONING THE SANITARY ENGINEER WHEN THEY COMMUNICATE WITH ADVERTISERS.

Digitized by Google

BENNOR SYPHON TRAP

Will recommend itself to

ARCHITECTS, PLUMBERS AND SANITARY ENGINEERS,

Because: *First*—It is a perfect seal under all circumstances, with or without water.

SECTIONAL VIEW OF VALVE.

Second—By the peculiar construction of the valve in connection with its syphoning force the trap and adjoining pipes are kept clean and free of coating.

Third—It cannot become clogged.

Fourth—It is simple, durable, cheap and easily adjusted.

Bennor Syphon Trap Co., Limited,

17 North 9th St., Philadelphia, Pa.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

B. P. BOWER & CO., Manufacturers, Cleveland, O.

Every Subscriber should have one of our neat BINDERS to preserve the copies of THE SANITARY ENGINEER for future reference. Price $1.00. Postage paid.

Rider Hot Air Pumping Engine

TO

CAMMEYER & SAYER,

93 Liberty Street, New York,
and 20 W. Lake Street, Chicago, Ill.

Please mention this paper.

ERICSSON'S NEW PAT.

Caloric Pumping Engine

is especially intended for domestic use in lifting and forcing water from wells and cisterns, or from Croton pipes, to tanks on upper floors of buildings in city or country.

This pumping engine is entirely safe, no steam being employed, and is not liable to derangement.

All kinds of fuel will answer for this engine, but coal-gas is preferable, the consumption being only 15 cubic feet per hour. Besides, gas is handier and cleaner than coal or other combustibles. Servant girl can operate it.

Price for 6-inch cylinder, pumping 200 gallons per hour 50 feet:
With gas furnace, $210. With coal furnace, $220
Price for 8-inch cylinder, pumping 350 gallons per hour 50 feet:
With gas furnace, $260. With coal furnace, $275
Price for 12-inch cylinder, pumping 800-gallons per hour 50 feet:
With coal furnace only.....$375
Price for duplex 12-inch cylinders, pumping 1,600 gallons per hour 50 feet; with coal furnace only.....$550

THE BRIGHTON.

There is a tendency in some quarters to demand a Hopper form of Water Closet and to dispense with what are called mechanical parts. This would be desirable, if the so-called mechanical parts did not secure advantages in the matter of a large body of water in the bowl, not otherwise obtainable, without resorting to methods not everywhere applicable or sufficiently demonstrated as practicable.

The Brighton Closet here illustrated is, we believe, the best compromise yet devised between the Hellyer form on the one hand and the Hopper on the other.

By examining the sectional cut, it will be seen that the bottom of the bowl is covered with water, while the flush and shape of the bowl is such that the trunk on the back is kept clean.

It is attractive in appearance, being all in one piece, of white earthenware.

The pipe *B*, connected with the trunk, can be run into a heated flue when desired.

These Closets have had a large sale in England during the past four years. We have had them in use in our factory nearly two years—and we now offer them to those who prefer a different form of Water Closet than the *Hellyer, which, by the way, does not, in a single instance, so far as we know, fail to satisfy those who have them in use.*

This will be known as

"Meyer, Sniffen & Co.'s Water Closet Apparatus No. 30."

Persons interested are invited to call at our warerooms, Nos. 46 and 48 Cliff Street, New York, or at No. 1 Pemberton Square, Boston, and examine this and other specialties that we have fitted up with water attached, including THE ROYAL PORCELAIN BATH, THE MODEL PORCELAIN SLOP HOPPER, THE HELLYER CLOSET AND HOPPER, THE THOADS HOPPER, DOHERTY SELF-CLOSING COCKS, FULLER FAUCETS, etc.

MEYER, SNIFFEN & CO.

BOYLE'S PATENT

Tidal Wave

WATER CLOSET.

Patented in all principal countries.

SECTIONAL VIEW.

A—Air Pipe. C—Supply Pipe.
B—Flush Pipe. D—Vent.
E—Connection for Fresh Air Pipe.

A New Departure in Water Closets.

The closet is made of one piece of earthenware, and supplied with Waste-Preventing Cistern coming under the lowest rate of taxation, as adopted by the Department of Public Works of New York.

Wherever in use, the closet has given entire satisfaction, and is recommended by leading authorities on sanitary matters as coming up to the requirements of a first-class appliance of its kind, being

Simple and Positive in Operation, Clean in Use and Perfect in a Sanitary point of view.

Write for Descriptive Circulars.

Further attention is called to

BOYLE'S PATENT

Universal Waste Preventing Cistern

AND

COMBINATION LEVER.

DISPENSING WITH SERVICE BOX.

The Cistern Valve insures both a copious preliminary and after-flush for either Hopper or Cistern Closet, the importance of which is well understood by every plumber. The flush can be regulated from one to four gallons.

Cisterns furnished, Cast Iron and Copper-lined.

We manufacture all the Carr Specialties in

WATER CLOSETS, HOPPER CLOSETS, SWINGING URINALS, BATH AND BASIN SUPPLIES, Etc., Etc.

and will send our descriptive catalogue to Architects and the Trade upon application.

DEMAREST'S

Patent VALVE WATER CLOSETS,

MANUFACTURED BY

THE J. L. MOTT IRON WORKS,

Nos. 88 and 90 Beekman Street, New York.

We take great pleasure in calling the attention of our customers and all interested in fine sanitary work to the above water-closet, which is in all respects the same as our "Hygeia" Cistern Closet, only it is fitted with a large Valve (one inch waterway) suited to all pressures.

The valve is of the simplest kind, reliable and perfect in operation; it is positive in action, being operated by lever as shown in cut. The flushing rim ensures the wash of every part of the closet, and what is a most important feature, this is accomplished almost entirely without noise.

THE "PREMIER."

SIDE-OUTLET VALVE CLOSET.

THE "DEMAREST."

SIDE-OUTLET VALVE CLOSET.

The "Demarest" is undoubtedly the most popular closet of the kind in the market. Its large and largely increasing sale being proof of its superiority where a first-class article is required at a moderate price.

THE "CLIMAX."

DIRECT-OUTLET VALVE CLOSET.

The above is a very reliable direct-outlet closet, and has given good satisfaction wherever it has been used. The outlet is full four inches, which is an important feature in this style of closet.

We furnish Enameled Iron or Imported All-porcelain Slop Safes to fit all the above Closets.

COMPLETE ILLUSTRATED CIRCULARS WITH PRICES, SENT ON APPLICATION.

ALL OUR SANITARY SPECIALTIES ARE FITTED UP WITH WATER ATTACHED,

And may be seen at our Warerooms, Nos. 88 and 90 Beekman Street.

Trade Mark registered in the Patent Office, Washington, D. C., February 12th, 1878.

VOLUME 7. NUMBER 12. | NEW YORK, FEBRUARY 22, 1883. | SINGLE COPIES 7 CENTS. Price of Single Copies more than one week old dependent on number on hand.

Entered at the Post Office at New York, N. Y., as second-class matter.

THE SANITARY ENGINEER, *conducted by* HENRY C. MEYER, *is published every Thursday, at* 140 *William Street, New York. Its opinions upon all technical subjects are either prepared or revised by specialists.*

TERMS, $3 PER YEAR, IN ADVANCE.
Postage Paid.

OFFICE IN GREAT BRITAIN: 16 CHARING CROSS, LONDON.

E. & F. N. SPON, Agents.

TERMS 16*s.* 6*d.*, PER YEAR, IN ADVANCE. *Postage Paid.*

CONTINENTAL SUBSCRIPTIONS RECEIVED BY
F. A. BROCKHAUS, Esq., Querstrasse 29, Leipzig, Germany.
Subscriptions to the Continent of Europe and Australia, $4; China, Japan, Sandwich Islands, Mexico and Cuba, $4; South America, $5.

NOTE.

Persons in any of these countries can send us the subscription price, by calling at their Post Office and leaving with the official the equivalent in their own money, for which he will give them what is called a "Post Office Order," which, if enclosed to us will be paid by our Post Office, the same as a draft when presented by us.

Fractional parts of a dollar may be sent in postage stamps.

Subscribers will please notify us of any failure to receive the paper, and also of any change in their address.

For Advertising Rates see last page.

Entered according to Act of Congress in the year 1880, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

TABLE OF CONTENTS.

EDITORIALS: PAGE.

Was it Sewer Gas?—New York's Water Supply, No. V.—The Compensation of Water Works—The New York Herald's Subscription for Sufferers from the Floods—The American Public Health Association—The National Board of Health Appropriation—Sanitary Inspection of Brooklyn Public Schools—Protest Against High Buildings—Danger in Remodeling houses—Private Water Supply Companies 265-266

Atlantic Coast Resorts—Steam Fitting and Steam Heating, No. XVIII, by Thermus—Rats and Lead Pipe.....267-268

A London Residence—Trees in Towns..... 269

GAS AND ELECTRICITY:

The History and Progress of Gas Lighting—Electric Light Notes—Meter-ites..... 270

The Hot Water Supply of a Small Hotel—Grading Vent Pipes—The Warming and Ventilation of the Royal Courts of Justice—The Master Plumbers' Election..... 271

FOOD AND DRUGS:

Analysis of Quinine Pills—Brewers' Grains and Still Slops as a Food for Milch Cows—The Benefits of Sanitary Science..... 272

Reviews of Books—Notes—Gutter Flushing in New Orleans 273

Novelties—Construction Notes—BUILDING INTELLIGENCE from all parts of the Union, etc 274-275

Patents Relating to Drainage, Water Supply, Plumbing, Sewerage Gas Fitting and Manufacture, Steam and Hot Water Heating, Electric Lighting, etc..... 276

Mortality Returns—Registration of Births, Marriages and Deaths—Suicides in New York City During the Eleven Years Ending December 31, 1880—Surface Temperature in Paris....277-279

ADVERTISEMENTS 279-288

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

British Subscribers who wish to receive this paper, without interruption should renew their subscriptions a month before expiration, with Messrs. E. & F. N. Spon, London, in order that they may be able to notify the Publisher, in New York, of the fact.

NOTICE.—Correspondents will prevent needless delays and annoyance if they will address all communications, except those of a strictly private nature, to THE SANITARY ENGINEER. Checks should also be drawn to the same order.

WAS IT SEWER GAS?

The daily press mention an explosion which occurred recently in the cellar of a house in Cincinnati, which stood on the border of the inundated district. Several persons entered the cellar with a lighted candle, and the explosion followed, resulting in the death of three inmates and the serious injury of others. The explosion was attributed to "fire damp or sewer gas."

As everyone knows, sewer gas has a bad enough reputation without attributing to it accidents in which it is not probable that it played any part.

There are certain conditions under which the gases in sewers might produce explosive mixtures, but such conditions have not often been found, and we do not believe exist to-day. It is a mistake to speak of "fire damp" and "sewer gas" as synonymous terms, or even to imagine that "fire damp" forms any considerable part of sewer gas.

It is impossible to give any fixed composition for sewer gas, inasmuch as it varies with the amount of gases disengaged and the degree of perfection of the ventilation of the sewers. Moreover, the composition of the gas in any one sewer would vary greatly at different times. In some cases it would vary little from the composition of the outside air. Under ordinary circumstances it would contain more or less carbonic acid, and a little sulphuretted hydrogen, and marsh gas or carburetted hydrogen. In nineteen analyses made in 1829, by Gaultier de Claubry of the gas in the old Parisian sewers, the greatest impurity consisted of 3.4 per cent. of carbonic acid, and 1.25 per cent. of sulphuretted hydrogen. In sewers of good construction the carbonic acid would probably not exceed 1 per cent., and the sulphuretted hydrogen and marsh gas, if present, would be found in much smaller quantities.

When refuse matter is allowed to decompose *without access of air*, marsh gas will form a large part of the resulting gases.

Dr. Letheby, in his report of the examination of the London sewers in 1866, which were practically unventilated cesspools, states that he found as high as 88 per cent. of marsh gas in the sewer gas, and that it was frequently ignited by the candles in the hands of the workmen.

Dr. Angus Smith in his report on "Disinfection and Disinfectants," stated that the gas arising from the sewage matter at the bottom of the Medlock contained 5.35 per cent. of nitrogen, 5.84 per cent. of carbonic acid and 88.81 of marsh gas. He adds, however, that the matter "was extremely putrid, and the water over it putrid also, and therefore free, or nearly so, of oxygen."

These two cases are exceptional and cannot be taken as representing the composition of sewer gas. It is seldom that sewers are not provided with means for a more or less perfect ventilation, in which case the excess of oxygen would prevent any considerable formation of marsh gas.

It is clear, therefore, that it is unwise to attribute an explosion to sewer gas without some knowledge of the existing conditions.

The inundation at Cincinnati would naturally interfere with the proper flow of the sewers, but it is difficult to see how under these conditions—supposing the sewer was not ventilated at all—at this season of the year, and in so short a time, enough marsh gas could be disengaged to produce an explosive mixture with the surrounding air.

On the other hand the fracture of a gas pipe or main would be nothing strange under the circumstances, and although the supply of gas had ceased, the pipes would still contain it, and being forced back as the water rose, it would find an outlet at the first break, and soon form an explosive mixture.

In the case of the sewer gas we have a mixture in which the combustible portion very seldom reaches an amount sufficient to produce an explosive compound, to say nothing of a further dilution with air. With illuminating gas, however, the entire mixture is combustible, and consequently would require a larger admixture of air before becoming explosive.

It seems most reasonable, therefore, to attribute the explosion in question to illuminating gas and not to sewer gas, and the same may be said of the large majority of explosions reported from time to time.

NEW YORK'S WATER SUPPLY.

No. V.

THE SUPPRESSION OF WASTE.

In 1851 Manchester, Eng., received for the first time an abundant supply of water from its new water works, and has since been able to maintain a constant service. The managers realizing the importance of controlling the character of the plumbing work and fittings, attempted, like the authorities of Norwich, to stop the waste, acting under the authority conferred by the water works clause act of 1847, but it was found inadequate and they were unsuccessful. In 1858, 1860 and 1867, however, the corporation secured additional authority from Parliament and has since effectually controlled these matters. Manchester is therefore to-day a city where the

Digitized by Google

testing of fittings, and constant and systematic inspection of plumbing is solely relied on to restrict the waste of water.

We believe an average pressure of upwards of forty pounds to the inch is maintained, and yet under the admirable management there prevailing the amount of water delivered for all purposes is only about twenty imperial gallons daily (about twenty-four U. S. gallons). Thirteen of this amount is used for domestic purposes and seven for manufacturing, street watering, and fires. The authorities also claim that they maintain a sufficient pressure to be able to be put out fires in the highest buildings without the aid of fire engines. It should be stated, however, that water closets are not universal in Manchester, the tub system for the removal of excreta being relied on by a portion of the population. They use meters in all buildings except dwellings, and exempt them on sanitary grounds; where meters are used an ample supply for flushing water closets is insisted on. The meters used are all tested, and it is claimed that the variation does not exceed two per cent.

Mr. T. H. G. Berry, the superintendent, to whom we are indebted for much information, has stated that he preferred house-to-house inspection, because it enabled the authorities to keep informed as to the use to which water, not otherwise reported, was put, and the increased revenue from these discoveries amounted to about 1,200 pounds sterling a year, which, with the fees received for stamping fittings practically paid the cost of the entire inspecting and testing staff.

Plumbers are supposed to do the work in a building in accordance with the prescribed rules. When a building is fitted up and it is desired to have the water turned on, the plumber sends in a form filled out describing the character and number of fittings used. An inspector is then sent to see if they are all stamped and the work done in accordance with the regulations; if so, he makes a report to that effect. If not satisfactory the inspector writes to the plumber and tells him what is needed to secure his approval of the work. and the matter rests in the inspector's hands until his demands are complied with. The good faith of this inspector is tested by a chief or second inspector who has the first inspector's reports to verify.

The second inspector is in a different office from the first; he takes the reports for verifica- from the books in that office. If the first inspector is satisfied that the fittings and work in a building are all right, he makes an agreement with the owner as to the water rate to be paid, it being his business to find the owner and get the agreement signed, if the building is to be then occupied. Quarterly rentals are charged to the tenant and weekly rentals to the landlord. It will be obvious that from the responsibility placed on these inspectors they must be men of integrity and intelligence, a combination we regret to say not always found in men too often selected for such positions in this city.

There are eight so-called first or plumbing inspectors who make these agreements, and there are two second or supervising inspectors who only visit the building after the water is turned on, to see if any change has been made, waste exists, and if the proper rental is being paid. If an extra water closet is put up or any change made and not reported to the water office the offending plumber is brought before the water committee, and either fined or his name stricken off the list.

Of the waste preventing staff for house-to-house inspection there is one regular member, and the others are used as time from new work permits.

[To be Continued.]

THE COMPENSATION OF WATER WORKS.

A director of the New River Company, which supplies a part of London with water objects in *The Times* to a remark made by that paper regarding the water companies, that "they are entitled to nothing more than the price of their services, according to the amount supplied, exactly like the butcher, the baker, or the gas company," and says that the cases are not parallel, because the water companies furnish large quantities of water grates, for fire extinguishing. The director says he has never met with a butcher or baker who would supply 4,000 pounds of bread or meat for nothing, nor a gas company who would supply either a public or a private body with a million or two cubic feet of gas for the asking. It seems to us that *The Times* is right in the view it takes of this matter, if it means that a water company should be paid for its services in the same manner as any other dealer in a commodity of universal use, that is, reimbursed for its outlay and also remunerated for its risk and the use of its capital. The butcher or baker is not paid the actual cost of the meat or bread he furnishes. He receives enough to pay him for the spoiled meat or the bread which was sour. So the water company must be paid for what the consumers waste or the public uses. If the public will not pay for water used for extinguishing fires, the private customers of the company have to bear the expense. The public authorities do not think of this fact when they demand from a water company that it shall supply water for the public uses without charge, as is done in many instances. There are certain uses of a public water supply which directly benefit property rather than individuals, and property should pay its proportion of the cost of furnishing water. Where the public own the works, it appears from some statistics which have been collected that property actually pays in taxes for interest, etc., about one-third of the expenses of the works, and it will easily be seen that the lower the water rates, the greater the proportion of expense which is borne by property, and that where municipal authorities ease up on the taxpayers by compelling a company to furnish public water free, they burden the individual who is obliged to use the water for private purposes and force him to pay more than his proportion of the expense.

An equitable adjustment of the proportion between the share which should be borne by property and that which the consumer should pay, has not yet been attempted by competent persons, so far as we are aware. We commend the subject to the careful consideration of experienced managers of water works.

The New York *Herald* did a characteristic and generous thing last Sunday in announcing that it had opened a subscription list for the sufferers from the floods in the Ohio Valley and heading the list with five thousand dollars. While our sympathies are excited by the reports of present enormous losses of property, and considerable loss of life, and of the homeless and destitute thousands, we may remember that this does not exhaust the possible evils which may fall upon that section of the country. With subsidence of the waters, and the return of the inhabitants to their normal life will begin the prospect of a terrible evil, toward which all sanitarians are looking with dread. Will Cincinnati, Louisville, and the other cities which have been submerged, escape the pestilence which the summer heats may develop out of the wet soil, with damp houses and disorganization generally to foster their outbreak? Let us hope so, and while hoping so, do what we can to relieve the distress of the afflicted cities.

If the terrible calamity will force upon the politicians of Cincinnati the conviction that their health organization must be changed, and that result can be secured, one good purpose at least will have been served

---

The Executive Committee of the American Public Health Association met in Washington February 16. The time for the next meeting of the Association, which is to take place in the city of Detroit, was fixed for the second week in November. The principal subjects selected for discussion at this meeting, and with regard to which papers are requested, are the collection and publication of vital statistics, the causes of malaria, the preservation and adulteration of food including legislation relating to it, and house drainage.

The Sundry Civil Appropriation Bill is now before the Committee of Appropriations of the House of Representatives. It is understood that it appropriates $10,000 for the salaries and expenses of the National Board of Health, but allows nothing for investigations, the publication of a Bulletin, emigrant, inspection or refuge quarantine stations. It is probable that this will be amended either in the House or Senate, but as it now stands it shows that the House Committee has very little respect for the opinions of sanitarians.

The sanitary condition of the public schools is considered of such consequence by Health Commissioner Raymond, of Brooklyn, that he has assigned Dr. W. E. Griffiths, sanitary inspector of the Health Department, to the special duty of examining the school houses. His report of the condition of things in public school No. 15 (at the corner of Third avenue and State street), which he submitted to the Commissioner last week, is not a pleasant one. He says:

"On the first floor (which was originally used as a play ground) there is now one department, comprising 432 children. The ceilings are low (ten feet), the windows much smaller than in the upper stories. The cubic space allotted to 404 children and ten teachers is 41,600 feet, or a small fraction of over 100 cubic feet of air for each. The only means of adding to the air supply is by opening the windows and doors, thus creating drafts injurious to the occupants. The inlets for air supply to the furnaces are facing damp, unwholesome areas, which always contain dirt and litter from the school yard and the street.

Ten story apartment houses, none too secure against fire, are becoming common in this city, one of 14 stories is reported as to be built, and possibly those of twenty stories are in contemplation. A protest against this manner of building was made last week at meeting called by prominent citizens, among them some well-known physicians, at which these high buildings were attacked for depriving the streets of light and air and increasing the danger in case of fire. The physicians present went so far as to say the mortality was doubled in large apartment houses. A committee has been appointed to urge a change in the building laws to prevent the erection of these towers, and to secure the insertion of a clause providing for compensation to owners of adjacent property injured by them.

When a plumbing fixture is removed, or the room in which it stands is put to some new use, so that the fixture is permanently disused, too little care is generally given to making sure that the room is disconnected from the drains. Writing on this point, Mr. Fleeming Jenkin mentions the curious use to which, in such a case, a wash-basin had been put to, and not without danger, for it had been converted into a flower-stand, and, of course, the seal of the trap had dried out, and the basin became a direct connection between the drain and the house. When houses are partially remodeled, this point ought to be specially looked to.

It is very common for the citizens of a town, the water supply of which is provided by a private company, to grumble and to urge the purchase of the works by the town. The Niagara Falls *Gazette* takes the opposite ground, however, with regard to the Suspension Bridge Water Works, and advocates the transfer of the works to a company, stating that they would be better managed if owned and controlled by a company than by the village corporation. The town is bonded now for $70,000, and necessary extensions will require an addition to this debt of $18,000 or $20,000. There is a good deal of truth in the ground taken by the *Gazette*.

ATLANTIC COAST RESORTS.*

Through the courtesy of the National Board of Health, we are able to present the following abstract from Mr. E. W. Bowditch's report on the sanitary condition of the health resorts on the Atlantic coast.

Atlantic City, N. J., the favorite summer resort for Philadelphians and Baltimoreans, occupies a portion of a long, narrow, flat, sandy island, surrounded on all sides by salt water, and separated from the hard land by seven miles of salt marshes. It is naturally as unattractive a spot as could well be selected, lacking good well water, possessing an extended but not specially pleasing prospect, and with a possible bathing beach perhaps ten miles long, no portion of which seems to be free from dangerous undertow.

This island, three-quarters of a mile wide, and ten miles long, upon which the city is built, is separated from the marshes on the west by a deep creek, navigable for vessels through its entire circuit. The city water supply, introduced during the season of 1882, has been brought across the marshes from the hard land; the artesian wells in the city, sunk to a depth of over eight hundred feet (entirely through fine sand and gravel) failing to obtain water of even reasonably good quality. There are no brooks or other available source of supply on the island proper.

The resident population is not large, six thousand perhaps being an outside figure, but this is swelled in summer to fully fifty thousand, and, at times, runs as high as seventy thousand (for a single day), converting the city into a sort of Coney Island for the inland cities and towns near by.

The floating population, brought down daily by the several railroads, on trains exceeded in length and number only by those that leave Brooklyn and Bay Ridge for the breathing places on the Southern Long Island shore, are accommodated in great wooden pavilions similar to those seen at West Brighton beach, Coney Island.

The cottage element is widely different, and occupies mainly those portions of the city apart from that given up to excursionists. Taken as a whole, however, the effect is very cosmopolitan, and perhaps on that account more interesting than it otherwise would be.

Until this season, the only water used for drinking purposes was from cisterns. Not only cottages, but hotels accommodating hundreds of people, possessed no other supply of potable water. The highest portion of the island being less than twelve feet above the sea, nearly all cesspools and many of the privies are built so that there is standing water in them at all times. It is exceptional to find one otherwise, unless in the highest part of the island; this in itself would render the use of well water unwise.

Houses are obliged, by ordinance, to drain into cesspools, that are called tight, from having impervious sides, and sometimes tops. As the bottoms are, so far as noticed, invariably open, they should more properly be classed as modified leaching cesspools. Many are exceedingly primitive wooden structures, and some of the best hotels depend entirely on sunken boxes or barrels for the disposal of their kitchen sewage. Privy vaults are built in the same manner, and from those that at all times have standing water in them the stench is dreadful whenever the contents are stirred by the addition of further sewage.

In 1881 the sewers that existed were intended for surface water only. That this was wise seems evident, from the outfalls being at the rear of the city on the marshes, where sewage, if delivered, could scarcely be got rid of in any direction.

Of course, where cesspools and privies are provided with open bottoms, the soil pollution must become greater and greater every year, and at Atlantic City owing to the incredulity of people, it has been extremely difficult to apply the proper remedies, many residents still believing that because the level of the ground water rises and falls perceptibly, at times being coincident with the tides, that *therefore* all cesspool matter, other than solids, must work off through the soil, and so on to the sea, thereby entirely disappearing in an appreciably short time.

Such reasoning is fallacious, for when cesspool and vault matters are disposed of by soakage at such a depth below the surface, all proper oxidation is much retarded, if not entirely prevented, and foul matters remain latent indefinitely.

Wells.—Many tubular wells are found, from twelve to eighteen feet deep, in various parts of the city. As might be expected, the water from these, though abundant in quantity, is foul and unfit for use in the houses. For drinking purposes, therefore, cistern water only was permitted (1881), and so desirable is this considered that houses are rarely occupied unless there be a cistern on the premises of satisfactory size, and having a sufficient supply of water in it. There seems to be no regular custom about the use of filters.

Cellars.—Till recently it was by no means universal to have cellars under the houses, because the water is so near the surface of the ground. Latterly, however, houses are provided with apologies for cellars, made by raising the first floors high above the natural level of the ground, and either banking around with earth or building lattice work.

The sanitary condition of the city in the past has justly been a subject of criticism; so much so, that in May, 1880, a local board of health was appointed to attend to the cleanliness of the community. The board, which has proved itself a very stiff new broom, has already accomplished many gratifying reforms, and while only a beginning has yet been made, whatever has been attempted has been carried out fully in detail.

For instance, garbage is regularly and carefully removed in ingeniously constructed wrought iron carts, with little or no annoyance to the public, once in every twenty-four hours from the cottages, and twice during the same period from all public houses. As a result, the health of the city has been appreciably better. The service as now rendered seems, so far as it goes, both satisfactory and efficient, and what has been accomplished has been done in the face of very considerable opposition.

A word should be said about the luxurious and cozy little cottage hotels. So far as chambers, parlors, cooking, etc., are concerned, any one of the dozen or more that are to be found open the year round, will prove as comfortable and pleasant as even an invalid could ask. It is to be hoped that the bath-room and kitchen accommodations will, before many years, be equally good; unless they are, Atlantic City hotels will scarcely rank where they should.

Along the New Jersey shore, but more noticeably south of Atlantic City, are numerous small communities of summer residents, who live in very primitive fashion, lacking the freedom of a camp life, yet without many of the comforts of a civilized one. Houses are set on posts, garbage is piled indiscriminately on the ground outside, and shallow wells and barrel cesspools furnish water and dispose of sewage, respectively. One of these settlements, perhaps better in architecture than the average, is a collection of houses built upon a fresh water marsh, just back of the beach, some miles south of Atlantic City. The buildings are very slightly above marsh level—not more than a few feet, and are built in the manner described above. A more undesirable location and general arrangement it is difficult to imagine. The public privies were intended to be cleanly and of proper pattern, but at the date of visit (May 22, 1881) they were very filthy, and the iron boxes full to overflowing with fæces and rain water. By accident or design the public privies are located to the windward of the houses, and it is stated that a bad smell is frequently noticable from this source. It is not to be understood that this state of things is confined to this one place, or even to the Jersey coast, for similar instances can be found at intervals all along the shore to Mount Desert, and are most numerous, perhaps, at Martha's Vineyard and on Long Island.

To the north of Atlantic City, on the coast, beginning at the northern extremity of Barnegat Bay, is a succession of summer resorts, occupied by thousands of people, many of whom go daily to New York. Point Pleasant, Brielle, Manasquan, Sea Girt, Spring Lake, Ocean Beach, Asbury Park, Deal Beach, Elberon, Long Branch, Monmouth Beach, Low Moor, Seabright and Highlands, join each other, and occupy most of the coast between Point Pleasant and Sandy Hook. Perhaps a description of those most widely known will answer for all, more especially as they furnish at once examples of the best and the poorest on that portion of the coast.

"The Elberon" originally comprised twenty-five cottages and a small hotel, though latterly the fashion has been to extend the limits of the territory covered by the name, until now it is understood to be the court end of Long Branch (summer town), rather than a distinctly separate establishment.

Elberon Hotel, built in 1877, exhibits the first instance of intelligent hotel plumbing and general sanitary arrangement, combined with careful maintenance, met with in New Jersey. Probably many of the details might be somewhat differently arranged, with advantage, but the work is well planned and properly carried out. The outfall of the sewer on the beach might, perhaps, be improved and the cesspools omitted entirely, but in point of maintenance it is second only to the Ocean House at Newport, R. I. There is both well and public water.

Long Branch village (winter town) is not, as many suppose, on the water, but on the contrary, is half a mile inland. The summer town, however, which joins the winter town to the north of Elberon, is back from the cliff only so far as is requisite for an avenue and a narrow park on the water side. At West End, where the avenue turns an abrupt right angle, and just south of the celebrated Iron Pier, is the first of the large hotels, many of which face the avenue, within Long Branch limits. The public water works at Green's Pond, on the northern edge of Elberon, and half a mile south of West End, supply water for Long Branch, Monmouth Beach and Low Moor, the requisite pressure being obtained by a stand pipe. Of sewers it may be said there are none from Elberon to Sandy Hook, though there are one or two exceptions—notably the Elberon Hotel referred to, where the overflow from cesspool runs to the sea, and the Ocean Hotel, Long Branch, where a pipe is carried out under the Iron Pier, a distance of 900 feet. Fortunately, the soil is for the most part sandy over the entire distance between Deal Beach and Sandy Hook, so that the public water can be leached away through cesspools for a long period without serious trouble. At the large hotels, accommodating from 1,000 to 1,600 guests, one would expect to find the cesspools most troublesome, more particularly, perhaps, in connection with those public houses whose lawns and yards are contracted in size. This supposition is entirely borne out by facts. Some of the back yards are literally honeycombed with cesspools that, one after another, becoming clogged with grease and other filth, have been discontinued. To such an extent is grease troublesome, that at one hotel, where the distance between scullery sinks and cesspool is longer than usual, and less fall to the drain, the whole line of pipe is taken out and replaced once every season, being entirely choked with grease. Occasionally it is necessary to go through this operation twice.

But one hotel, so far as known, makes any effort to separate the grease from the waste water, but imperfect as the process is, it has prevented some two tons of grease from passing through the pipes, each season since the experiment was first tried.

At the Ocean Hotel is, perhaps, the best instance of a large and properly maintained earth-closet privy that has been seen anywhere. Twenty-eight closets (on two floors) empty into a brick vault. Earth (salt sand) is sprinkled three times daily upon the deposits, and the vault is free from offensive smells.

A portion of the sewage of the Ocean Hotel is carried through a six-inch wrought-iron pipe into deep water under the Iron Pier, delivery being into a sheet-iron tank having a perforated cover. This was carefully and thoroughly done, but the sewage from 1,000 people delivered at one point, only nine hundred feet from the bathing beach, is sometimes disagreeably noticed at the latter place. The other hotels, so far as visited, were all inferior, both in construction and maintenance, so far as their sanitary arrangements were concerned. It should be mentioned that the water closet tower of the West End, which is separated from the hotel proper, is kept sweet and clean, and must add very much to the comfort of the hotel. The maintenance throughout the hotel appeared to be excellent, but the principle of so large a building depending wholly on cesspools is wrong and should be superseded as soon as possible by sewerage.

Before leaving Long Branch hotels it may be well to call attention to an arrangement which, in a more or less modified form, is not unfrequently met with, but that in any form seems undesirable, and scarcely as cleanly as might be.

Swill Rooms appear to be a New Jersey invention. They are at times under a portion of the carving room and kitchen, or, what is unusual, on the same level. When located underneath, the garbage is dumped into a hopper and falls directly into the room, or vault, or sometimes into a cart that may be there for the purpose. When on the same level a wheelbarrow or buckets are made use of. Frequently the vaults are of brick, lacking adequate

*Report of E. W. Bowditch, C. E., to the National Board of Health.

Digitized by Google

ventilation, and kept in permissible order only by repeated applications of chloride of lime. Instances are noted where refrigerator wastes drip untrapped into the swill room.

In warm weather, few things are more disgusting or nauseating than sour, partially decomposed garbage, and the principle should always be to carry it off the premises as soon as possible, as is done at Atlantic City.

At Monmouth Beach there is but one public house and that one is used largely by cottagers in the neighborhood who go there for meals. From this point to Sandy Hook the land between the Ocean on one side and Shrewsbury River on the other is quite low, much of it marshy, and in places so narrow as to afford room for but a single row of lots on either side of the avenue, In fact, most of the houses are on the Ocean side only, and the stables on the other. The difficulties attending proper drainage are here shown in an aggravated condition, and the black, stagnant sewage near the railroad at Monmouth is suggestive of trouble in the near future, the beginning of which, perhaps, occurred in 1882 at a summer hotel in Seabright. The cottages on Monmouth, Low Moor and Seabright beaches, are all of the better class, except the remains of the fishing village and life-saving station at the latter place. At Seabright, opposite Navesink Highlands, the land is so low that it is difficult to obtain sufficient fall to run the sewage anywhere except into Shrewsbury River, and though this is done occasionally the remedy will be apt to prove more serious than the disease. The public water, furnished from Green's Pond, was not pleasant to the taste during the season of 1881, though the analysis made of it December 15, 1881, showed it to be "an excellent surface (river or pond) water." At times, during the summer, strings of green slime were occasionally drawn from the pipes, and the water proved cathartic in quality. This may have been due to a variety of causes, though the source of supply is not altogether what could be desired. A very considerable sum of money has been expended on the water works since that date, and much more will, undoubtedly, have to be spent before it is entirely satisfactory. It is particularly important that Monmouth and Seabright should be furnished with a plentiful supply of the best public water, as the low character of the land and the use of leaching cesspools renders well water as doubtful a benefit as at Atlantic City.

While recognizing the fact that it is far easier to criticize than to suggest adequate remedies, yet it is certain that before many years the whole coast from Navesink Highlands to Deal Beach (21 miles) must be sewered on some comprehensive plan, or there will be trouble.

That a satisfactory system can be designed does not admit of a doubt, though the least expensive arrangement for effectually disposing of the sewerage of so large a district will require some little study, and, more than anything else, an intelligent coöperation on the part of various towns interested.

[TO BE CONTINUED.]

STEAM FITTING AND STEAM HEATING.

BY "THERMUS."

No. XVIII.

(Continued from page 147.)

SAFETY VALVES.

The first part of this article was simply a resumé of prevalent ideas or of common practice in power boilers, and was given for the purpose of impressing on the steam fitter the fact that a hole in a boiler of a given size will let out a greater weight of steam at high pressures than at low ones, and that, consequently, a greater opening of the safety valve is required for a low pressure heating apparatus to relieve or remove the steam made, and not allow the pressure to increase above the low pressure maximum, than would be necessary for a high pressure one, the amount of water converted to steam being the same in both cases.

The above will apply to all apertures in boilers, whether safety valves of a constant and invariable opening (patent valves which give a full opening at once), or to pipes of fixed sizes; but probably does not apply to common valves (assuming that they are sufficiently large for the high pressure), as the common valve has a variable lift—being greater for *low pressures*—the increase of lift or opening for low pressures being presumed to be in as great a ratio (at least for a 4-inch disk) as the decreased velocity and density of the steam. Thus, the conclusions the steam fitter should draw and fix in his mind are: 1st. That with a safety valve that will give a fixed opening of the full size of the disk at all pressures—by some extraneous or differential principle—a very much smaller valve (nominally) will do, and that it must be proportioned for the greatest evaporation at the lowest pressure. 2d. That if common valves are used, the disk or nominal size must be of large proportions, beyond all doubt, so that no matter how little the lift may be, the annular opening around the edge of the disk will be sufficient for the greatest amount of evaporation (by weight) at the highest pressure.

The practical question to the fitter now is, what size opening (area of aperture) will do for steam at the different pressures?

To arrive at any intelligent conception of what the aperture should be, it is necessary to know the velocity of flow of steam into the atmosphere (at the required pressure) per second of time and the weight of a given bulk of the steam at the same pressure.

About the weight of steam, there is not much question, but for the velocity of steam at high pressures there is a difference of opinion, so much so, that at 100 pounds pressure above atmosphere the minimum velocity, flowing into the air, through the most favorable shaped aperture, may be taken at about 1,900 feet per second, while one authority puts it as high as 2,750 feet; while at 10 pounds above atmosphere the greatest variation in formula will confine the difference to 200 feet, the minimum being about 1,200 per second. In this problem, and in all others wherein there are doubtful factors, the benefit of the doubt should be given to the side of safety, and in this case, the slower we assume the velocity for steam the larger will be our opening or safety valve. But another question here interposes, namely: Will 1,200 feet per second at 10 pounds pressure and 1,900 feet at 100 pounds pressure do for all shaped openings? Certainly not. A round hole, one square inch in area, will admit more steam to pass in the same time than an opening of $\frac{2}{16}$ of an inch all around a 4-inch disk, but what the loss will be for the latter shape, or for any other shape is again an unknown quantity, which *may reach one quarter* (?) for ordinary valves and turns in escape pipes. Thus, to be on the side of safety, it is better to reduce the 1,200 feet to 900 feet and the 1,900 feet to 1,425 feet (for the respective pressures mentioned), to provide for the contingencies of ordinary practice and modes of connecting.

With regard to the *relative volume of steam* any of the tables given are sufficiently correct for this purpose, and 1060 and 260, respectively, for 10 and 100 pound pressure above atmosphere will do.*

Then if we have, say, one cubic foot of water converted to steam at 10 pounds pressure and occupying a space of 1060 cubic feet, what will be the area of the hole in square inches, that will allow it to pass in one hour, the velocity being 900 feet per second?

Perhaps the simplest rule to do this by, so as to give a lasting impression to the ordinary reader, is to have him imagine or calculate what length 1060 cubic feet will make if it is stretched out to one square inch in section, and calculated. Thus—1,060 cubic feet x 144 = 152,640 feet in length, divided by 3,600 seconds = 42.75 lineal feet per second, divided by 900 feet per second = .0475: the fraction of a square inch for each cubic foot of water evaporated in an hour; = 2.37 square inches for a 50-horse power boiler; being very nearly the size of an 1½ pipe.

Again for the higher pressure (100 pounds) 260 x 144 = 37,440 ÷ 3,600 = 10.4 ÷ 1,425 = .00733; the fraction of the square inch for each cubic foot of water evaporated in an hour = .3665 of a square inch for a 50-horse power boiler.

Another point of interest to fitting is an easy method of finding the *weight* necessary for a safety valve.

If they reason this way they will always be able to find the required weight within practical limits and approximately correct. If the area of the valve disk is one square inch, it is only necessary to have a one pound weight placed on the top of it (assuming itself to have no weight) to keep it closed against one pound per square inch of steam, and of course if the weight is 10 pounds, it will hold the disk against 10 pounds per square inch. This is substantially the "low pressure safety valve" with the weight on a spindle on the back of the disk; the weight of the disk and the "weight" having a total effect (without leverage) of the square inches of the valve multiplied by the maximum pressure to be carried. But with valves with levers for high-pressures wherein the weight must be fixed and kept within ordinary limits of size, the relative position of the weight to the disk must be considered and the weight of the lever also.

The lever always represents a constant resistance to the valve and should be found first. For instance, with a disk of one square inch, with a lever of *one* pound, the lever being ten inches long as shown, and the distance from the valve spindle to the fulcrum one inch, the lever will always exert the same pressure on the disk as a *one pound weight* would, placed on the lever at half its length (five inches). Thus it may be borne in mind that the lever is a weight hung on an imaginary lever of half its own length and exerting power according to its weight.

In this case where the lever is one pound, and the distance from the fulcrum to the spindle one inch, and the whole length ten inches, the lever will exert five pounds on the valve *without a weight*. But it is necessary to have a weight which is movable, and suppose we have one, of just *one pound* also. If we placed this weight, now, on top of the spindle it adds just one pound to the force exerted by the lever (5 + 1 = 6) making the total power at that point six pounds; but if we move it the same distance from the spindle that the fulcrum is, only in the opposite direction (out on the lever), it will exert two pounds additional to the power exerted by the lever, and will exert an additional pound per inch as it is moved from the disk, giving for the end of the lever 15 pounds and for the first notch seven.

If instead of a one pound ball or weight we can get only a 2½ pound ball, the power exerted by it will be, the weight 2½ pounds by first notch (2 inches) = 5 lbs. + 5 lb. for lever = 10 lbs., or by last notch, 2½ x 10 = 25 + 5 = 30 lbs.

*For those not sufficiently versed in the terms applied to steam it is well to explain that the 1060 and 260 are the times a given bulk of water is increased by being converted to steam at these pressures.

Our correspondents have sent to us several instances of the damage which rats may do to lead pipes, and have pointed out the risk of escape of sewer gas from this cause where this metal is used for soil pipes. An interesting incident in this connection has been reported by London *Builder*, from Berlin. A wet spot in a wall, near where a water pipe ascended, led to examination, and on opening the wall a number of dead rats were found in the recess made for the pipe, which had been knawed clean through. It is supposed the rats had been drowned by the escaping water.

One hundred and ninety-six thousand, eight hundred and ninety-three inspections were made and 15,325 complaints received during 1882 by the Board of Health of this city.

SECTION OF A LONDON RESIDENCE SHOWING THE PLUMBING.

A LONDON RESIDENCE.

For the above sketch, which shows the method of plumbing of a London residence of the better class, we are indebted to Mr. Francis Botting.

Our American readers will notice several features that are different from the practice in this country. Notably, the water closets discharge into a pipe that receives no other drainage. The other fixtures drain into pipes that discharge over open-mouthed traps.

The arrangement of the main trap, fresh air inlet and communicating chamber, is good, though we do not like the house drain buried under basement floor, as seems to be necessary in a house planned like the one shown.

TREES IN TOWNS

A correspondence has been recently carried on in the local press at Geneva as to the value, or otherwise, of trees in streets and open spaces. Dr. Piachaud contended that trees in streets do more harm than good, that they impede the circulation of the air, and that, as for the shade they afford, people who do not like sunshine have only to keep on the shady side of the street. Instead of planting more trees, as some propose, he would rather, in the interests of hygiene, remove all existing trees. Professor Goret, of the University, who, though an eminent physicist and chemist, disclaims any special knowledge of medicine of hygiene, has replied. He treats the matter from a common-sense and scientific point of view. He says that trees in streets temper the heat and serve as a protection from dust, and that the evaporation from their leaves tends to keep the surrounding air cool and moist; that the perpetual vibration of their foliage and swaying of their branches, whilst admitting a sufficient amount of light, serve to protect the eyes from the noonday glare. Professor Goret's last argument is that the roots of trees draw up stagnant waters and absorb the organic matters contained in the filth from which the streets of a town are never free, and which, after infiltrating the ground, are a frequent cause of fevers and infection. Trees, in fact, have the same effect on the subsoil of towns as fields have on the contents of their sewers—they act as disinfectants. Taking these facts into consideration, the Professor strongly recommends the planting of trees, at proper intervals, in streets and squares. He also condemns the practice that prevails in many continental towns of cutting the trees down to a uniform size, as the branches of trees so treated become so impacted as to be impervious to light, and the shade they give under such circumstances, although deep, is too circumscribed to be of much use.—*Lancet.*

E. G. LOVE, Ph.D., *Gas Examiner.*

THE HISTORY AND PROGRESS OP GAS-LIGHTING.

Mr. Arthur H. Elliott delivered a lecture upon the above subject before the Chemical Society of the School of Mines, Columbia College on Friday evening Feb. 16.

The lecturer began by reviewing the condition of public and private methods of illumination before and up to about one hundred years ago. Speaking of candles he described the various devices for obtaining a better light by burning them in an inclined position and by using compound wicks of cotton yarn and wire twisted together. By inclining the candle at an angle of about thirty degrees, the black snuff was consumed by coming into contact with the air, the carbonaceous material projecting out at the side of the flame. With the cotton and wire twist, as the candle burned the wire untwisted and spread the snuff around outside the candle flame, allowing it to be better consumed.

For outside illumination lamps and torches carried by individual travellers were first used. Afterwards an organized brigade of torch boys was introduced into the larger cities. But it was not till the sixteenth century that any systematic lighting of the public thoroughfares was inaugurated and when Paris was first lighted with lamps, containing tallow candles, the event was a notable one. This lighting was instituted by a Lieutenant of Police in Paris, as a means of public safety, and it cast such a new aspect over the city, that a medal was struck to commemorate the event. A system of this character was in use in London, in 1800. The oil lamps used for lighting these lamps were said to be equal to half that of a tallow dip.

In Paris, in the year 1821, there were 13,360 public lamps of oil and tallow. And as late as 1844 there were over 3,000 such lamps.

The idea of using coal gas as a means of illumination is due to a Scotchman named William Murdoch. He experimented at Redruth in the county of Cornwall. He made gas from different kinds of coal, lighted his house and offices with it, and even collected some and carried it to light a locomotive upon which he travelled between the mines of which he was manager.

In 1798 he entered the service of Boulton and Watt, the engineers at Soho, near Birmingham. Here he made further experiments, and in 1802 made a public exhibition of gas by illuminating the works in honor of the peace of Amiens.

In 1805, Murdoch lighted a large cotton mill at Salford, Manchester, replacing twenty-five hundred candles with gas jets, at a cost of $3,000 per year, against $10,000 formerly paid for the candles.

While Murdoch was at Soho, a young man named Samuel Clegg, was apprenticed to Boulton and Watt, to learn engineering; but when he met Murdoch his attention was directed to gas lighting rather than engine building.

In 1805 he left Soho and built a gas works to light the largest cotton mill in the British Isles, at Sowerby Bridge, near Halifax. But neither Murdoch nor Clegg had any idea of the possibilities of gas lighting.

In 1803, a man named Winsor appeared in London, who was the first individual to realize the scope of gas lighting. He instituted lectures upon coal gas at the Lyceum Theatre in London; and being unlearned in the English language, he hired men to do the talking while he made the experiments. At these exhibitions he carried the gas in flexible tubes, showed the brilliancy of the light, the freedom from sparks, that the flames could be placed in any position, and that gas jets could not be so easily blown out as the flames of oil lamps.

In 1807 Winsor set up a number of gas lights in Pall Mall, London, this being the first time gas was used as a street light in history,

Winsor ultimately obtained a charter for a gas company from the English Parliament.

During the discussion of the Bill in the House of Commons, William Wilberforce branded the scheme as a bubble imposed on public credulity. Sir Humphrey Davy asked with a sneer if it was proposed to use the Dome of St. Paul's for a gas holder. The butchers opposed the new gas scheme, because the price of tallow would fall and they would have to charge more for the lean meat. The ship builders were aroused. Hull had built two thousand ships for the whale trade and made directly and indirectly thirty-five millions of dollars by it. London, Peterhead and Liverpool had almost as valuable interests at stake.

While Winsor was working up his gas company in London, Murdoch and Clegg were improving the apparatus to manufacture coal gas. They erected a number of sets of gas lighting plant in various places; each apparatus being an improvement on its predecessor.

About this time Heard, the former assistant of Winsor, used both lime and oxide of iron to take the sulphur out coal gas. And Clegg used milk of lime in the tank of the gasholder at Sowerby Bridge.

In 1812 Clegg lighted the large book and print store of Mr. Ackermann, in the Strand, London. The affair was such a success that in the following year, when only thirty-two years old, he was made sole manager of the various works of the Chartered Gas Company and saved them from failure.

In 1813 Westminster Bridge was lighted by gas, and the next year St. Margaret's parish. From this time forward gaslighting was a series of the most brilliant successes.

At first pipes of lead were used, and patents were issued for those made of wood and paper, but finally ordinary wrought iron pipe was found to be the most convenient.

In Paris, in 1802, Le Bon made gas from wood and lighted his house with it. In 1819 the first street light from gas was on the Faubourg St. Denis. But Frenchmen were slow in adopting gas. In 1829 there were only forty gas lights in the streets of Paris; and as late as 1844 there were over three thousand oil lanterns to nearly seven thousand gas lights.

In Germany, Lampadius and Pruhtl followed the English plan of isolated systems of lighting. These were used in 1811 in Freiburg and in Vienna. But Sir William Congreve, an Englishman, was the first to make public lighting a success in Germany in the year 1825. And the city of Hanover was the first to open its streets to the enterprise. Dresden adopted it in 1829, Vienna in 1833, and other cities very rapidly after this date.

In America gas was made and used as early as 1813, by David Melville, at the Bath House, Newport.

In 1821 Baltimore made an attempt to introduce gas. Boston succeeded in 1822, and the following year New York came to the front by organizing the New York Gas Light Company. The first house lighted by gas was on Cherry street, and was the residence of Mr. Samuel Leggett, the first president of the new gas company.

Speaking of the progress of gas lighting, the lecturer remarked that in New York city six companies can supply about thirty millions of cubic feet of gas per day, about three-fifths of which is coal gas, the rest being wood or water gas.

The streets of New York are lighted with about twenty-five thousand gas lamps, which are supplied through about nine hundred miles of mains, and use three hundred millions of cubic feet of gas per year.

At the close of the lecture a number of pictures were exhibited with the magic lantern, illustrating the various stages of the ordinary coal gas process, and also those of the water gas process. The latter pictures were photographs of interiors of the Works of the Municipal Gas Light Company, which had been lent by Mr. W. H. Bradley for the purpose of illustrating the lecture.

ELECTRIC LIGHT NOTES.

The Light-House Board, on the 12th inst., approved the project for establishing an electric light on Dry Romer, New York Bay.

The telegraph committee of Philadelphia councils has reported favorably an ordinance granting permission to the Metropolitan Underground Telegraph, Telephone and Electric Light Company to lay wires in certain streets.

The English Board has resigned from the Faure Electric Accumulator Company and the concern has gone over wholly to the direction of Mr. Philipport. This is the company which we recently referred to as having stopped making accumulators and gone into the business of selling "rights."

A bogus statement has been going through the press that the Board of Aldermen of Boston had passed an order prohibiting the lighting of the city by electricity. The report is denied by Superintendent of Lamps George H. Allen, and the fact is that the Aldermen ordered the entire city to be lighted with electricity.

Mr. Enos Barton, President of the Western Electric Company, has been interviewed by the Chicago *Times* on the subject of underground electric wires. The only underground wire in Chicago at present is that of the Western Indiana Company, which has been used for six months and has given satisfaction. A single tube contains 20 wires, and the cost of the system is about $3,000 per mile. Mr. Barton considered the system entirely practicable, and thought that a new company would find it cheaper at the end of ten years to put its wires underground; for a company with an existing overhead system the change would entail a large expense.

The electric light tower over Central Market House, Cleveland, fell down on the 9th inst., when a height of 200 feet had been reached. The Cleveland *Leader* says the structure was to be built entirely of gas pipe, and was triangular in shape. The work was begun several weeks since under the supervision of a man sent there by the Elgin Company. He had never before superintended such a job, but the Elgin Company being crowded with orders thought they could trust the work in his hands. When several sections of the tower had been erected, however, it became apparent to the Brush Company that the superintendent did not understand his business. He was, therefore, succeeded by Superintendent Cunningham, from Elgin. The poor work was not taken down, however, and in consequence the structure fell.

Meter-ites.

An explosion of gasoline works took place the 9th inst. in a restaurant in Norfolk, Va., which wrecked the building and injured six persons.

The Chief Engineer of the Philadelphia Gas Works reports that 3,337,490 gallons of tar were furnished to the contractors from the works in 1882.

The State Department of Pennsylvania has granted a charter to the Citizens' Gas Light, Heat and Power Company, of Chester. The Company has a capital of $100,000.

A vein of natural gas was struck the 13th inst., at Hills Station, near Pittsburgh, Pa., at a depth of 1,170 feet; and igniting it set fire to the derrick and shanty. It is intended to use it at the Glass Plate Manufactory at Hills Station.

The Bureau of Statistics of the Treasury Department reports that in December, 1882, the export of petroleum and petroleum products was 30,201,639 gallons valued at $2,952,914. The total export for the year amounted to 503,492,642 gallons, valued at $44,623,074, against 514,561,719 gallons, valued at $48,556,103 in 1881.

It is reported from Batavia, N. Y., that a man and wife retired on a Saturday night in a room adjoining one in which was a coal stove. The escape of gas rendered them both insensible, and they remained unconscious until Monday morning, and not until late in the day did they discover it was Monday, not Sunday. Such is the story.

The report of Mr Luce, the Michigan State Oil Inspector, shows that during 1882 there were 133,678 barrels of oil inspected, at a total cost of $16,682.61 the receipts in excess of expenses being $4,702.72. The price of inspection was reduced to 15 cents a barrel in 1881, and he now recommends a reduction of the inspection fee to 13 cents per barrel.

The flood at Cincinnati effected a temporary transformation in the mode of lighting. Sunday evening the 11th inst, the gas failed, and resort was had to oil, candles and the electric light. The Brush Company put lamps into several hotels and theatres, including the Grand Opera House, and the sale of candles and oil lamps reached such a point as to raise prices to scarcity rates. The streets, except the few that had electric lamps, were dark and deserted.

A short time ago a company known as the Water Gas Company of New Orleans purchased from the United Gas Improvement Company of Philadelphia the right to use the latter's patents in the State of Louisiana, and obtained from the New Orleans Council the right to manufacture and sell their gas in that city. They bought a site for works and were going ahead when the old New Orleans Gaslight Company applied to the courts to restrain them. Negotiations followed, which have resulted in the United Gas Improvement Company buying back from the Water Company their patent rights for New Orleans and reselling the same to the old company, which will now alter their works to manufacture the water gas.

A FORTUNE FROM A WELL.

Mr. Henry L. Goodwin, of East Hartford, Conn., made a good share of his fortune by a curious sort of monopoly. He was a California "Forty-niner," and in those early days, when San Francisco and its vicinity had a wretched poor supply of drinking water, he was one evening charged half a dollar by a man who owned a well for a drink for his oxen. That made him mad, and he resolved that he too would become known as a Man-Who-Owns-a-Well. With the aid of his partner, an engineer, he bored eighty feet deep on his town lot, and there struck an inexhaustible supply of the best water yet found on the whole coast. Then he established a free drinking fountain for all passers-by, but for all other purposes he sold six gallons for a cent. Cattle owners could have their stock watered for 50 cents a yoke per week. For a long time every one who wanted pure water had to go to Goodwin's well for it, and a handsome fortune was realized therefrom.—*Tribune.*

The Slaughter House Reform Society of London, have raised £1,300 to establish a small model *abattoir.* The object of the society is to teach the most rapid, skilled and humane methods of slaughtering, to advocate *abattoirs,* to insist on the necessity of cleanliness, and to bring into use the completest means of removing the offal, blood, and other substances, and to promote thorough inspection.

A large number of water meters have been frozen in Rochester, N. Y., during the recent cold weather, in consequence of neglect of the rules of the water board concerning protection against frost. The Board have notified consumers, on whose premises meters are placed, that they must keep them protected or pay the damages.

THE HOT WATER SUPPLY OF A SMALL HOTEL.

To the Editor of THE SANITARY ENGINEER:

I wish to supply hot water to some fifty wash basins in a small hotel, and seven baths. The hotel has a main building with two wings, enclosing a sort of court, as shown on the plan, Fig. 1, and there are rooms with wash basins on each side of halls running entirely around. I shall have wash basins and baths on two floors. Shall use a coil in a laundry stove to heat my water. Now, I want to know what size of pipe I had better use. Lead will be the material. The pipe will be laid on boards under the floors to give a good grade. I also want to know in which way I had better run my pipe. You will see I am obliged to take the pipe around each floor, because I cannot cross over on account of the court. Had I better first rise with the hot water pipe to second floor, direct from boiler, then run around that floor, drop to first floor, and run around that, then drop to boiler, as in Fig. 2? or had I better rise to first floor, then run around that, then rise to second floor, and run around that, and return to boiler thus, Fig. 3?

I should prefer the first, because I think I can get rid of the air easier with that arrangement, by taking an expansion pipe over the tank from the point *A*, giving pipes on second floor a slight pitch toward *B*, and on the first floor toward *C* in this plan, Fig. 2. It is also my opinion that I should get a more rapid circulation with this arrangement, because I believe there will be more difference of temperature between the flow and return than with the arrange- shown in Fig. 3, and I am anxious to have hot water at the farthest basin in either case. Will you please answer my questions and suggest any improvements which will likely give the hottest water at the last basin?

CONVERSE.

[It is much better to take the hot water from the boiler to the upper story direct, and let the return come from nearest basin back to coil. This is the plan shown in Fig. 2. If the heating coil is at one end of either wing, let the connections between the floors be by a pipe coming down at the end of the other wing. By this means is secured a continuous circulation. Better in some ways would be a riser in the centre of the main building, branching both ways for the wings. The connections between the floors would then be downwards at the ends of both wings, and the circulation would be completed by the return pipes coming together into a main return at the side of the riser. By this means each circulation would only be half as long, and pipe of smaller diameter would be called for. By carrying up the direct pipe to the second floor, not only will Converse get rid more easily of his air and vapor, but he avoids the great difficulty of the plan in Fig. 3. In this latter plan an occupant of a lower room would cut off the supply of hot water to those above him by opening his faucet, when the pressure was small from the water-works or tank. In Fig. 2 there will always be a head upon the lower basins even when the upper ones are in use. With regard to the size of pipe which should be used, it would be best practice to choose one large enough to insure free circulation and a considerable volume of water in the pipe at any one time. Since it is not likely that a very large number of the fifty wash basins or all the baths will be in use at one time, probably 1½-inch pipe could be made to answer, though two-inch would be better.

An experienced plumber of this city recommends that galvanized iron pipe and not lead should be used, as lead will be liable to breakage at joints of branches owing to unequal expansion.]

FIGURE 2.

FIGURE 3.

FIGURE 1.

GRADING VENT PIPES.

To the Editor of THE SANITARY ENGINEER:

Will you please advise me what means plumbers in your city take to prevent condensation filling vent pipes and making them no good? It is not always possible to give them a steady pitch.

[They are so arranged that there are no pockets or traps in them, and so that the water of condensation can flow back to the waste pipe in some way. It sometimes requires considerable ingenuity to accomplish this, but that should be exercised every day in the plumbing business.]

THE WARMING AND VENTILATION OF THE ROYAL COURTS OF JUSTICE.

The warming and ventilation of the new Courts of Justice was a subject to which the architect, the late Mr. Street, gave much thought, and it was not until several plans had been elaborated and rejected, that the existing arrangements were decided on. The scheme adopted divides the plan of the building into four nearly equal parts, by lines running at right angles through the centre of the great hall. To each of these is fitted a separate apparatus, the four being alike in power and construction; they are capable of working separately or together, and are arranged so as to be able to work into each other's systems. The medium employed is hot water on the low pressure principle, circulating through pipes formed into ranges and clusters, and measuring in all a little more than eleven miles in length, the water is heated in four 50 horse-power boilers, situated in the crypt under the four angles of the great hall. There are two other boilers of the same dimensions for the generation of steam to be employed for the engines used for propelling air into the courts, and for heating the coils of pipe in the ventilating shafts. The scheme will thus be seen to have been arranged broadly into four divisions, all of which have been again divided into sections of high and low levels. Each section and division is connected, not with the boilers directly, but with arterial mains, which are carried round the crypt, linking the four boilers together. While the general building has been thus provided for, special attention has been bestowed upon the warming and ventilating of the courts themselves, each court being treated separately both as regards its heating and air propelling power. Below each there is a chamber divided into two equal compartments; in one the requisite power is provided to warm and maintain the courts to a temperature of from 58° to 60° in the coldest season with an interchange of air, equal, if necessary, to 10,000 cubic feet per minute. The other compartment is used for cold air. These two chambers merge into one and are covered with a coarse cloth, which is used for mixing and filtering the air before it passes into the court through numerous vertical openings provided behind the wall linings and at at other convenient points. The entrance to these two compartments is under control from the lobbies of each court, so that the air driven in by the fans can be passed through one or the other or partly through both, and can be tempered and mixed to suit every condition of the atmosphere. The supply of air, which in summer is calculated to reach nine and a quarter millions of cubic feet per hour, is drawn from the whole of the areas surrounding the great hall, and is freed from dust and smut by being passed through a fine water spray. The withdrawal of the vitiated atmosphere is accomplished by means of powerful steam coils placed in the ventilating shafts to which access is given by numerous openings in the ceilings and gallaries. Thus far the arrangements we have described have been for the purpose of warming the building. It was felt, however, that it would be necessary to cool the air in hot weather, as well as to circulate it, and for this purpose an ether refrigerating machine has been erected in the crypt consisting of a pair of engines, vapor pumps, refrigerators, and condenser. This machine is of sufficient power to reduce 1,000 gallons of water per hour from 70° to 40° Fahr. The water thus reduced can be converted to fine spray by an "atomizer," and the air passed through it. The cold water that is not absorbed is collected in a cistern and conveyed to the condenser, where it is used to abstract the heat given off by the ether in liquifying, and is finally allowed to escape at a temperature of 90°. A recording thermometer is attached to the inlet and outlet pipes of the cooler, so that the temperature of the service water to the sprays can be adjusted to a nicety.—*The Engineer.*

MASTER PLUMBERS' ELECTION.

The Master Plumbers' Association of this city have elected the following officers for the coming year: President, Col. George D. Scott; First Vice-President, Joseph A. Macdonald; Second Vice-President, N. G. Geraty; Third Vice-President, A. L. Whitelaw; Fourth Vice-President, E. Murphy; Fifth Vice-President, W. Young; Recording Secretary, A. Mead; Financial Secretary, George Mead; Corresponding Secretary, E. B. Cunningham; Treasurer, Alfred Ivers; Sergeant-at-Arms, John Mitchell.

Just previous to the election, Sir Isaac Walpole said that certain members of the club seemed to regard every conflagration as a matter of Providence. He believed in Providence as firmly as the next man, but he didn't run the pipe of his cook stove out of the back window, nor plug up holes in the stove with a pine stick.—*Proceedings of the Lime Kiln Club.*

THE ANALYSIS OF QUININE PILLS.

To the Editor of THE SANITARY ENGINEER:

In your issue of December last you merely mentioned the fact that the Philadelphia *Medical News* had employed an "expert analyst" to examine the various brands of coated quinine pills, and that five out of seven of the samples had been found not to contain the proper amount of sulphate of quinine.

As THE SANITARY ENGINEER aims to do the fair thing, and as it is one of the very few journals, having a scientific reputation, which paid any serious attention to the statements published by the *Medical News*, I beg to be accorded a hearing.

I can positively state from my own knowledge that the quantitative results obtained by the Philadelphia analyst are about $\frac{8}{100}$ grain short of the truth in the case of two of the more prominent brands mentioned in the report. I have frequently examined the pills made by these two houses, and know whereof I affirm. I believe that this error of $\frac{8}{100}$ grain is tolerably constant, and is due to the very inaccurate method of assay which was employed. The use of excess of ammonia, and shaking the alkaline aqueous mixture with ether are two things which cannot fail to render the results short of the truth. This matter was carefully explained in a subsequent edition of the *Medical News*, and need not be repeated here.

The object of the present paper is to present a method for the separation of quinine from coated pills which has given me remarkably accurate results. I have used it for some months, and would have published it sooner were it not that I have been making careful trials with pills of exactly known composition in order to determine accurately the "limit of error" which might reasonably be expected.

The process which I have used may be termed a "dry process," to distinguish it from the "shaking out" methods most commonly recommended. The latter are valuable where the mixture examined is not too complex, and even in experienced hands, may give very close results in some complex mixtures, but in the case of quinine pills they have not afforded me as accurate results as are to be wished. It seems desirable, therefore, that some method corresponding to the lime-assay methods for cinchona barks should be developed.

Take a sufficient number of pills to represent twenty or forty grains of sulphate of quinine. The smaller number of grains is sufficient if manipulations are made with care and the balance is sensitive to tenths-milligrammes.

Treat the pills in a very small Wedgewood mortar with five cubic centimetres of cold distilled water, until the coating dissolves and the pill mass may be ground under the pestle to a smooth, uniform paste. To this paste add two grammes of freshly slaked lime (calcium hydrate) in powder. Mix thoroughly, and dry the mixture slowly in the mortar by means of a steam or water bath.

If glucose has been used as an excipient, the mass, in drying, will be colored yellowish, owing to formation of decomposition products, the result of the action of the lime upon the glucose. These products do not interfere with the separation of the quinine in a pure state; the latter substance is not injured by the lime.

The dry mass should now be finely powdered and transferred to a Tollen's apparatus,* for continuous percolation, and thoroughly extracted with stronger ether. Upon evaporation of the latter from a weighed dish or flask, the quinine is left in residue. By drying for one hour, at 125° C., the quinine is rendered anhydrous ($C_{20}H_{24}N_2O_2$), and may then be weighed. The weight of anhydrous quinine, in grammes, multiplied by 20.7673, will give the number of grains of sulphate of quinine $[(C_{20}H_{24}N_2O_2)_2H_2SO_4, 7H_2O]$ in the pills examined.

Where a Tollen's extraction apparatus is not at hand, very accurate results may be obtained by simply transferring the dry, powdered lime and pill mass to a small, flat-bottomed flask, and measuring in a known amount of stronger ether, corking well, agitating occasionally, and allowing to stand for not less than 12 hours.

By use of an accurate pipette, an aliquot portion of the clear ethereal liquid may be withdrawn and evaporated cautiously in a weighed dish.

A little experience is necessary to ensure accurate results. The mass may be removed from mortar and pestle almost completely by use of a small steel spatula. In making the paste, previous to the addition of the lime, considerable labor may be saved if the mass is confined to as small a portion of the mortar as possible. With a deep, narrow mortar 3 c. c. of water is often sufficient; the use of more lime may be advantageous in some cases. The dried mass is easily pulverized, is not so light as to be lost in dust, and may be readily transferred from the mortar. The quinine separated is free from impurities.

I find that chloroform cannot be used in this method of assay, owing to the fact that the decomposition products from action of lime on glucose are dissolved by chloroform and impart to the quinine thus separated a red color and very decided excess of weight.

By digestion in a flask with stronger ether, as above described, the following results were obtained: The pills employed were taken at random from a lot of 21,733, which were known to contain 43,690 grains of sulphate of quinine ($7H_2O$). Each pill contained, therefore, 2.0057 grains of sulphate of quinine.

Duplicate results were 2.0113 and 1.9968 grains sulphate of quinine per pill, the average being 2.0041 grains per pill.

Ten of the same lot of pills, extracted by stronger ether in a Tollen's apparatus, afforded 20.0031 grains of sulphate of quinine.

I am inclined to think this method thoroughly reliable, and capable of affording, in every case where carefully followed, 1.99 grains for every 2.00 grains of sulphate of quinine ($7H_2O$) used.

I am indebted to my assistant, Mr. D. L. Haigh, for the careful performance of much of the work here recorded.

HENRY B. PARSONS.

BREWERS' GRAINS AND "STILL SLOPS" AS A FOOD FOR MILCH COWS.

A correspondent asks us to refer him to authorities on the "effects of feeding brewers' and sugar-house or spent grain to our milch cows."

The best *résumé* on this subject that we have seen is that by Prof. C. F. Chandler in Johnson's *Cyclopædia* (article "Milk," division entitled "The Effect of Foods on the Milk.—Feeding."). The titles of several works in which more or less is written on the subject are there given.

As the matter is one of some general interest, we quote the following for the convenience of those interested, who have not easy access to the original:

"Brewers' grains are the staple food in town dairies, and they are much more nutritious than their appearance seems to warrant. Even in the wet condition in which they are obtained from the breweries, and holding from 75 to 77 per cent. of water, they contain a fair proportion of ready made fat and flesh forming matter. Desiccated grains contain about 7 to 8 per cent. of oil and about 18 per cent. of nitrogenous compounds. Dried brewers' grains make good milk, and are fully as valuable as a food for milch cows as barley meal."

"Much discussion has arisen with regard to the propriety of feeding cows on the exhausted barley of breweries, *brewers' grains*, and on the swill of distillers, *still slops*. To the former, used in moderate quantities, there appears no objection whatever; even the latter, 'properly fed in limited quantities, in combination with more bulky food, may be a valuable article for the dairyman; but if given, as it too often is, without the addition of other kinds of food, it soon affects the health and constitution of the animals fed upon it. * * * When this forms the principal food of the milch cows, the milk is of a very poor quality. * * * Its effect on the systems of young children is therefore very destructive, causing diseases of various kinds, and if continued, certain death. * * * The adulteration of pure milk from the healthy cow by water, though dishonest and objectionable in the highest degree, is less iniquitous in its consequences than the nefarious traffic in 'swill milk,' or milk produced from cows fed entirely on 'still slops,' from which they soon become diseased, after which the milk contains a subtle poison, which is as difficult of detection by any known process as the miasma of an atmosphere tainted with yellow fever or cholera. The simple fact is sufficiently palpable that no pure and healthy milk can be produced by an unhealthy and diseased animal, and that no animal can long remain healthy that is fed on an unnatural food and treated in the manner too common around the distilleries of many large cities.' (C. L. Flint, in 'Milch Cows and Dairy Farming'). By the laws of the State of New York the milk of cows fed on distillery swill is declared to be unwholesome and its sale forbidden."

THE BENEFITS OF SANITARY SCIENCE.*

Rome, had her aqueducts furnishing her citizens with pure water, and she also built sewers, but there was nothing like sanitary science as we now understand it. Even England, with all her greatness and wealth of intellect, was the very hot bed of disease, and to her history we turn for instances of the most ravaging of pestilences. What could be more terrible than the Black Assizes, held in Oxford in the year 1577, where all who were present in the court—the judge, the sheriff and three hundred persons—died within forty-eight hours! Or the sweating sickness of 1522, of which the poet Armstrong writes:

> "Infectious horror ran from face to face,
> And pale despair. 'Twas all the business then
> To tend the sick, and in their turn to die.
> In heaps they fell, and oft one bed, they say,
> The sick'ning, dying and the dead contained."

What could be more appalling than the black death of the Fourteenth Century, which reappeared in epidemic form as the plague five times in seventy-two years; in one year (1665) carrying off nearly seventy thousand persons, and in five years 160,000. So terrible was this disease that one writer says: "The plagues of London do commonly kill one-fifth part of its inhabitants." We of the present day living at the North can have no idea of such an epidemic as visited London in the near 1665. Dr. Hodges who practiced in that city at the time, has left a very graphic account of the plague as it appeared in that epidemic, and the narrative of Defoe depicting the scenes of daily occurrence is full of incident and pathos. All the infected houses were closed with their inmates imprisoned within them and were marked with a red cross. Written over the door was, "Lord have mercy on us." Dr. Hodges tells us that "In some houses carcasses lay waiting for burial, in others persons in their last agony. In one room might be heard dying groans, in another the ravings of delirium. No order, age or sex was spared. It was not uncommon to see an inheritance pass successively to three or four heirs in as many days."

When we learn the manner in which the English people of those days lived, we are surprised, not that epidemics occurred frequently, but that they were ever absent. Most of the buildings were of wood and so plastered over that a breath of fresh air was an entire stranger. Our ancestors had to pay a window tax, and so even the light was excluded. The floors of the houses generally were made of loam strewed with rushes, constantly put on fresh without removing the old, lying there in some cases for twenty years, concealing fish bones, broken victuals and other filth." And this is what is called "the good old time!" I have that it would be a glorious day when the youthful science of preventive medicine shall attain its majority. It may be that some think I have overdrawn the picture of the benefits which through it will accrue to mankind. Let us see, then, whether anything has thus far been accomplished by adhering to the principles already established. Unfortunately, the life of our own republic is too short, and the recorded facts too meagre to learn much from a study of its history, but if we turn to Geneva, Switzerland, we shall find records of births and deaths complete for three hundred years. From these we learn that in the sixteenth century the average period of human life was a little over twenty-one years; in this century it has risen to forty years. Then more than one-fourth of the children died in their first year, now less than one-sixth. In the sixteenth century only three per cent. lived to see their three score and ten years; now eighteen per cent. live beyond this age. As many now live to be seventy as then died at the age of forty-three. In Liverpool, before proper sanitary measures were introduced, thirty-eight persons in every thousand died each year, now the number is but twenty-four. I could give such proofs as these almost without limit; could tell you how the mortality in England's Indian army has been reduced from sixty-nine in the thousand to twenty; how during a single decade more lives have been saved in that army than formed the entire British army at the battle of Waterloo; how in Croydon the death rate has been reduced from twenty-five to sixteen; in Salisbury from forty to seventeen, and in Dover from twenty-six to fourteen, but I think I have shown you that the claims of preventive medicine are not the boast of a braggart, but that with proper encouragement and co-operation she will accomplish glorious results.

* From an Address by Dr. J. H. Raymond, Health Commissioner of Brooklyn, in the lecture course of Long Island Hospital.

Reviews of Books.

JAPAN. ITS ARCHITECTURE, ART AND ART MANUFACTURES. By Christopher Dresser, Ph. D., F. L. S., etc. Scribner & Welford, 1882.

Every one would be glad to know something about Japan if he could be sure of getting at what he wanted without too much trouble. Since Commodore Perry opened the country to our civilization thirty years ago, its arts and manufactures have entered all our households, and strange rumors of this strange people have filled our ears. But meanwhile, books of travel, of history, and of critical commentary have multiplied, and most of us are afraid to begin to read them lest we shall never get through.

Here Dr. Dresser comes to us as a guide and friend, and enough of a philosopher to make his company entertaining and instructive. His book gives a narrative of four months which he spent in travelling through the length and breadth of the island, studying its manufactures and museums. The narrative is animated and amusing, telling just what any one would have seen upon the surface of things if he had enjoyed the same rather unusually favorable opportunities. What the author's special studies, as a student and teacher of decorative art, enabled him to discern, more than would reveal itself to the common eye, he wisely keeps out of this narrative, embodying his observations and reflections in a series of essays which occupy the last half of the volume. For these the personal narrative affords an admirable preparation.

These essays treat separately of pottery, lacquer work, metal work and the decoration of stamped and woven fabrics, with a final chapter upon paper-making, basket-making and other minor industries, and an introductory chapter upon architecture and the general principles of design. These are all admirable and interesting, and tell just what one wishes to know, except, perhaps, the last mentioned, which seems somewhat meagre and lacking in ideas. It is rather discouraging, at this late day, to find a leading writer upon decorative art quoting the crude and ill-digested "Principles" prefixed to Mr. Owen Jones' "Grammar of Ornament," as if they were a species of gospel. The fact that they are contradicted by almost every page of the Grammar itself, has frequently been pointed out. Better and more intellegent is the second chapter, upon analogies and symbols, in which the origin of the special decorative forms found in Japanese art is discussed, and their possible historical relations with cognate forms found in India, Persia, Arabia, Egypt and Greece is pointed out. Dr. Dresser presents with great force the value of such a comparison of decorative forms as a means of tracing the migrations of races, their commercial relations and their kinship by blood. The chapter closes with an enumeration of the curious and surprising resemblances between the arts and civilization of Japan and those of Ancient Egypt, in character rather than in specific forms, adding new and independent testimony to facts to which attention was long ago directed by Mr. Fergusson. But while both peoples seem to have carried the manufacturing arts to the highest perfection, absolutely without the aid of machinery, and both to have been controlled in all social, religious and political matters by strict fetters of custom, the Japanese exhibit to this day a freedom of mind and facility of invention to which their ancient prototypes offer no parallel.

Although Dr. Dresser presented himself in Japan as the bearer of certain objects contributed in London towards the formation of a Museum of European art at Tokio, he seems to have used the opportunities this office afforded him for directing the attention of the Government to the means rather of preserving their own manufactures than of adopting foreign methods. It is satisfactory, moreover. to be able to infer from what he says, that, in general, as good work is done now as at any past time, and that a reaction against innovation is already taking place, so that industries which, after the fall of the Daimios, in 1868, seemed likely to perish for want of their patronage, are reviving under the stimulus of foreign trade. Still the total impression left by the book is that a mercenary and commercial spirit cannot but be fatal to an art which owes its perfection, as these pages plainly show, to a singularly pure and universal spirit of artistic devotion. This serene and childlike temper seems to have been greatly fostered by the purity and mildness of the two religions that have contended for, or rather shared, the superstitious reverence of his hitherto happy people.

The illustrations, though needing color for their full efficiency, are ample and helpful. Many of them are engraved by Japanese artists especially for this work; yet the book would be readable and entertaining without them. But it sadly needs a map and a sufficient table of contents.

THE TOWERS AND STEEPLES DESIGNED BY SIR CHRISTOPHER WREN. By Andrew T. Taylor, Architect. London: B. T. Batsford, High Holborn.

Mr. Taylor's essay, which recently gained the medal of the Royal Institute of British Architects, though encumbered with some paragraphs of amateurish fine writing, as prize essays are apt to be, is creditable and serviceable. The illustrations consist of fifty-one elevations, or perspective views, and sixteen sections of the towers and spires erected by Wren after the fire of London. Though many of these structures are pretty ugly, fantastic in idea, and paltry in execution, others of them have a felicity of composition that makes them profitable subjects of study and quite justifies their reputation.

The drawings are sufficient for their purpose, though apparently not very accurate. At any rate, the elevations and sections seem not always to hang together.

Besides the introductory essay, which contains some pertinent and not uninteresting historical information, a brief account is given of each structure, giving dimensions and other statistics, and sometimes running on into critical expressions, generally of praise, which might as well have been omitted. At the end is a somewhat perfunctory plea for the preservation of the churches for which there is no further use, or at least, for that of their towers. It is, altogether, a book for every architectural library of good size, and might prove suggestive, in these Queen Anne days, to the active practitioner.

BOOKS RECEIVED.

THE CONDITION OF NIAGARA FALLS AND THE MEASURES NEEDED TO PRESERVE THEM. Eight letters published in the New York *Evening Post* the New York *Tribune* and the Boston *Daily Advertiser* during the summer of 1882, by J. B. Harrison, New York, N. Y., 1882.

SUICIDES IN NEW YORK CITY DURING THE ELEVEN YEARS ENDING DEC. 31, 1880. By John T. Nagle, M.D. Read before the American Public Health Association, at Savannaht Ga., Nov. 30, 1881. Cambridge: *The Riverside Press*, 1882.

QUARTERLY REPORT OF THE CHIEF OF THE BUREAU OF STATISTICS, TREASURY DEPARTMENT, relative to imports, exports, immigration and navigation, for the three months ending Sept. 30, 1882.

FOURTH ANNUAL REPORT OF THE STATE BOARD OF HEALTH OF KENTUCKY, 1882.

An action was brought by a plumber in the Croydon, England, County Court against a civil engineer for upwards of $150 for the erection of a lavatory. Defendant made a counter-claim of $600 on the ground that the work, being improperly done, sewer air escaped into the house, and caused the illness of six members of the household, and the death of his son. He, therefore, claimed the doctor's bill and other expenses. The judge struck out the plaintiff's claim and gave judgment for the defendant.

An iron platform suspended inside the stand pipe now being erected for the Nashville water works for workmen to stand on, fell to the bottom a distance of 68 feet recently, through the giving way of the supporting chains, killing one workman and seriously injuring another.

The attention of the health officers of Philadelphia, was last week directed to the existence of an epidemic in a lane of that city. The corpses of two persons who had died of it had remained without attention for a week.

Residents in a certain district of Philadelphia, have complained to the Board of Health, that malarial fever is caused by the accumulation of the sewage of 138 houses in a pond in a sunken lot, and that ice is being gathered from this pond.

Senator Chapman of the Ohio Legislature, has a bill creating the State board of health to consist of seven members appointed by the governor, with the confirmation of the Senate. The bill requires the board to meet quarterly at Columbus, and a veterinary surgeon is to be appointed who shall investigate the existence of epidemic diseases among domestic animals.

The Hartford milk inspector has examined 36 samples of milk from city milkmen and finds seven adulterated either with water or skim milk.

GUTTER FLUSHING IN NEW ORLEANS.

The Committee on flushing, of the New Orleans Auxiliary Sanitary Association, in its last report, presented Jan. 12, in 1883, by its Chairman, Mr. Edward Fenner, comments as follows:

"The erection of the flushing pumps was considered by the Sanitary Association but the initial step toward correcting the long existing evil of defective drainage. While performing the important service of purifying the gutters of every perpendicular street, by carrying rapidly to the drainage canals the filth of the most populous portions of the city, it must be borne in mind that it greatly assists the cleaning of the gutters of the streets running to the canals by the corporation gangs. The perfect success of this system has but two obstructions.

"1. The defective grade and irregular capacity of many gutters.

"2. The inability of this committee to estimate the means that may be at its disposal during the current year.

"To avoid the perplexity consequent upon unknown annual contributions, this committee petitioned and had granted to them by the late city government, an annual sum of ($10,000) ten thousand dollars, to be paid in monthly installments. Of that appropriation $5,833.33 has been paid. The remainder may never be paid. The Executive Committee have petitioned the present city government to include in the budget for 1883 the sum of ($10,000) ten thousand dollars towards defraying the cost of runn ng the flushing pumps—a sum not perhaps in excess of the expense of cleaning (but not purifying) by the city gangs the great length of gutters rendered innoxious by a stream of fresh river water.

"It remains to be seen whether an amount so insignificant, when contrasted with the object to be attained, can be spared from the reserved fund of the city.

"This committee has frequently called your attention, and that also of the city government, to the existing condition of the drainage canals. At the earnest solicitation of of your Executive Committee, the Administrator of Improvements, Mr. John Fitzpatrick, did undertake, in the month of January last a plan of improvements to the drainage canals, which, if carried to completion, will result in incalculable benefit to the health and prosperity of the city.

"If the work so auspiciously commenced be now discontinued, it will prove a great calamity, not only in retarding, it may be for years, a reform of the utmost importance, but all the money it has cost might as well have been thrown into the river. If one year is permitted to pass before labor is resumed, the canals will relapse into their former filthy and unhealthy condition.

"From this deplorable result of legislative and municipal neglect and ignorance, it is the duty of the People's Association to rescue this city. That our citizens may know that this committee base their allegations upon facts, a few instances of what we term 'neglects' and 'ignorances' may be stated.

"Galvez Canal was paid for as being eight (8) feet deep; yet the work, so well done by the Administrator of Improvements last spring, developed the fact that at certain points the excavation did not exceed two feet in depth, and the original stumps and roots remained. Thus the main receiving canal for the drainage of the most populous portion of the city, eighteen feet wide and 5,156 feet long, as stated by Dr. Jones, 'is an immense mass of filth accumulated from the gutters and open sewers of the city.'

"The Toulouse Canal, intended to be the direct outlet from the Galvez Canal to the Bienville draining wheel, is a mere ditch, ten to twelve feet wide and from one and a half to two feet deep. Again, the drainage of Canal street depends entirely upon a narrow, inadequate trunk or conduit in Claiborne street which is also taxed with the drainage and flood water of Customhouse, Bienville, Conti, St. Louis and Toulouse streets, now leave the route of the water to its final outlet at the Bienville wheel.

"Millions of the people's money have been squandered, and years of engineering skill have been consumed in giving to the city of New Orleans a system of drainage such as we have in part described, which, in the words of Dr. Joseph Jones, President of the Board of Health, has contributed during the past thirty-four years toward sending to an untimely grave 118,094 people—an estimated loss to the city of one hundred and eighteen millions of dollars.

"As stated, Mr. John Fitzpatrick, Administrator of Improvements, at the earnest solicitation of this association, made great exertions to correct the evils we have pointed out.

His expenditure was.....	$32,799 00
Whilst this committee expended for lumber, labor, pumping, etc., in aiding the work.....	4,247 91
And had expended in preparation for the excavations for dams and gates, etc...	2,444 51
Total expenditure by this association.....	$6,692 42
Making a total of.....	$39,492 22

"If this great work is now abandoned but little benefit will accrue from the money already spent, and it may result in total loss, as the canals will rapidly fill up and relapse into their former filthy and dangerous condition. What is the history of municipal undertakings but a record of schemes of improvements exciting great expectations seldom realized during the incumbency of the originators; abandoned by the newly elected for some plan destined to share the same fate."

Novelties.

Under this heading we propose to supplement our section on patents by descriptions and illustrations of new appliances put on the market. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and IT IS TO BE DISTINCTLY UNDERSTOOD THAT A NOTICE DOES NOT IMPLY APPROVAL. *No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.*

SOCKET WRENCH.

The tool described below is the invention of Mr. Wm. G. Pride, of 326 Reid avenue, Brooklyn, N. Y. It is designed for turning nuts, drills, etc., in confined places.

The accompanying drawings are one-half full size. Figure 1 is a section through the axis of the cylindrical head and the middle line of the handle when in the disengaged position shown in Fig. 2, which is a plan or view of the under side of Fig. 1, while Fig. 3 is a view of the same side, showing the parts engaged, as in use.

The cylindrical head, *A*, is provided with teeth extending across the edge around the whole circumference, and in each face between the rims *a* and *a'* is a channel or groove *a''*, running parallel with the circumference. Through the centre of the head, perpendicular to its faces, is a slightly tapering, hexagonal opening, in which is inserted the socked *d*, which has a square opening, *G*, at its upper end to receive the nut to be turned, the shank or lower portion being made hollow to admit the portion of the bolt extending beyond the nut. The socket may also be attached at one end of a stem, the other end of which is made to fit the opening in the head, for use in specially confined places where there is room only for the socket. This nut socket may be replaced by another form suitable for holding drills. For use with the latter a breast rest or other contrivance is provided to enable the operator to force the drill in while turning it.

The lever bar *C* is slotted at one end, and at the extremities of the prongs or jaws, *B B*, are studs, *e e*, projecting inwards and fitting into the groove *a''*, thus attaching the lever bar to the head while allowing it to play freely around it. In the back of the slot is pivoted on the pin *f* a vibrating segmental shoe or brace, *E*, the front edge, or that next the head, being an arc of a circle of the same diameter as that of the cylindrical head, and having teeth corresponding to those on the circumference of the same. When in the engaged position the edge *c*, on the back of the segmental shoe, rests against the surface at the end of the slot, which is indicated by the lines *c' c'*. The action of the wrench may now be understood, we think, from the plans Figs. 2 and 3, without further explanation. The operation, it will be seen, is like that of a ratchet-drill or pawl-wrench.

In the other end of the lever bar is a square socket to receive the handle *D*, which is held in by a pin, *b*. The handle is curved, and may be inserted in any one of four positions for convenience in operating it in different locations.

Construction Notes.

CHICAGO.—The county commissioners, Feb. 12, received the following bids for reconstructing the ventilating and sewerage arrangement of the jail and criminal court buildings: J. J. Wade, $11,500; W. B. White, $10,300; Bassett & Beaver, $9,447; M. B. Bailey & Co., $9,800; Richard Graham, $11 500; Alex. W. Murray, $8,608; James H. Roche, $9,200; Andrew Young, $8,899; Bufton & Boyd, $7,900.

NAHANT, MASS.—The desire of summer residents for a water supply has caused the matter to be earnestly discussed in the town, and at the next town meeting steps will probably be taken toward securing one. The two projects which are most discussed are the obtaining the the water from the city of Lynn or from Sluice pond in Lynn, owned by the Lynn Aqueduct Company, which is recommended by Engineer Bowditch, in case water cannot be obtained from Lynn.

ROCHESTER, N. Y.—The contract for the iron pipe for power purposes for the Lyell street lift bridge was awarded the 13th inst. to the Mellert Foundry and Machine Co., of Reading, Pa., at $39.58 per gross ton. The contract for the bridge, which was originally let to the Hudson Bridge Co., has been transferred, at their desire, to the Pittsburg, Pa., Bridge Co.

NEW YORK.—The contract for supplying the electric lighting apparatus for the East River bridge has been awarded to the United States Illuminating Company of this city for $15,500. This covers the entire plant for seventy lights including the two engines which are to be stationed on the Brooklyn side. Each engine will run an independent circuit, feeding alternate lamps on both sides of the bridge so that only every other lamp will be extinguished if an accident happens to one engine. By contract the work is to be completed in 60 days.

BUFFALO, N. Y.—Bids received for brick for the main sewer which is to be constructed according to the plans of Col. George E. Waring, Jr., were all informal, and that part of the work has been re-advertised. On American cement, after the decision to award to a Rosendale bid, the local interest in favor of Buffalo and Akron led to a postponement. Portland cement, 10,000 barrels, was awarded to Sherman Bros. & Co., of Buffalo, at $280 (for Brooks, Shoebridge & Co.). Iron castings at 3 cents per pound to Jacob Genther, Buffalo.

MOMENCE, ILL.—The Chicago *Tribune* of the 12th inst. says: It is reported that a syndicate is being formed to buy the dam and mill property at Momence, Ill., which is to be sold at Kankakee next Tuesday. The intention of the syndicate is to make extensive improvements to the property and utilize the immense water-power there. If this scheme is carried out, it will prevent the drainage of the Kankakee marshes, for the accomplishment of which a bill is now pending in the Legislature, at an expense of $650,000. The marsh lands were surveyed last summer by Prof. Campbell by order of the State, and he recommended that they be drained.

REGINA, N. S.—A water company has been formed to bring water from Boggy Creek, three miles distant.

MEMPHIS, TENN.—The following bids have been received at the Treasury Department, Washington, for the construction of the Marine Hospital Buildings, Memphis, Tenn.:

	Extension Building.	Two Wards.	Surgeon's House.	Kitchen, Dining-room and Laundry.	Stable and Dead House	Total.

BIDS FOR WATER MAIN FOR GOVERNMENT INSANE ASYLUM.

WASHINGTON, D. C., *Feb.* 7, 1883.

To the Editor of THE SANITARY ENGINEER:

I take the liberty of asking for some information, if you have it, in regard to the proposals for laying a water main, as advertised in your paper, from Greenleaf Point to the Government Hospital for Insane. Bids were to be opened some time during January but I have seen no mention of it either in any of the city papers or yours.

Respectfully, JAMES RAGAN.

[We are informed that the bids received under the advertisement, were not such as the appropriation would admit of being accepted, and the whole matter has been indefinitely delayed.

PROPOSALS RECEIVED FOR GOVERNMENT DREDGING.

In Saginaw River in front of Bay City, Mich., opened February 14, 1883, by Major F. U. Farquhar, Corps of Engineers, U. S. A., the three lowest bidders were:

Castle Sutherland, East Saginaw.....$0.25 per yard.
D. W. McConnell, Buffalo, N. Y..... .35 per yard.
Thos. M. Hubbell, East Saginaw. ..... .37 per yard.

The bids submitted varied from 25 cents to 48 cents per cubic yard.

In Saginaw River, above Bay City, Mich., opened February 14, 1883, the three lowest bidders were:

Gaskin, Stickney & Crane, East Saginaw.. $0.37½ per yard.
Thos. M. Hubbell, East Saginaw..... .39 per yard.
David McConnell, Buffalo, N. Y..... .40 per yard.

The bids submitted varied from 37½ cents to 52 cents per cubic yard.

At the bar at the mouth of Saginaw River, Michigan, opened February 14, 1883, the three lowest bidders were:

David McConnell, Buffalo, N. Y..... ..$0.30 per yard.
Castle Sutherland, East Saginaw..... .60 per yard.
George Talbot, Buffalo, N. Y..... .65 per yard.

The bids submitted varied from 30 cents to 96 cents per cubic yard.

WANTED, BY NEW YORK DEPARTMENTS, 15,000 feet of hose, 2½ inches internal diameter. Proposals will be received until February 28, by the Fire Department, 155 and 157 Mercer street. Also, by the Fire Department, until February 28, four steam fire engines, each to weigh not more than 4,700 pounds when fully equipped—boilers 30 inches in diameter, cylinder 8-inch diameter and 7-inch stroke.

The Boston Board of Aldermen have requested the Mayor to petition the Legislature to obviate the necessity of including in the tax levy of Boston the amount of the interest on the Mystic Water bonds. The Mystic Water Works supply the towns of Everett, Chelsea and Somerville as well as part of Boston. By the annexation of Charlestown to the city a few years ago, the works, which had been built independently, were included in the city,

Digitized by Google

and the debt was assumed by the city. The outlying towns now take their water under contracts with the city, and the object of the action proposed, is to compel these towns to share the burden of the cost of the works, the benefits of which they receive. As one of the aldermen remarked in the debate on the proposition, if there is a deficiency now, the city has to pay the whole of it; if there is a surplus, the outside towns share the benefit.

The city of Harrisburgh, Pa., is about to take a new departure in the management of its water works. Heretofore they have been in charge of a committee of the city council. The present committee seem to be men of good sense, for they have agreed upon an ordinance which they request the council to pass, relieving them of the responsibility and placing the department in charge of a superintendent who is to appoint all his own subordinates and give bonds for the faithful performance of his duties. This officer is to be elected by the council, but no person shall be eligible who has not been examined by and received a certificate of capacity from a Board of Examiners appointed by the Mayor.

Col. William Ludlow was elected by the Councils of Philadelphia on Feb. 15, Chief Engineer of the Water Works; William Dixey was at the same time re-elected Commissioner of Public Property.

WASHINGTON, D. C.—Cast-iron and fire-proof columns for new pension office building: James Peviotlett, Columbia, Pa., $88 each; J. D. Manshbank & Son, Philadelphia, $109; Wight Fire Proofing Company, Chicago, $69; Wight Fire Proofing Company, Chicago, $62; Wight Fire Proofing Company, Chicago, $48; C. 265,945. BOILER-FURNACE. JOHN COLLIS, Des Moines, Iowa. Filed Feb. 16, 1882. Issued Oct. 17, 1882. (No model.)

Claim.—1. In a boiler-furnace, the combination of a double-walled fire-box and vertical boiler-section having a skeleton top, a horizontal boiler section and dome, an outer wall or jacket, and an annular plate having an opening to allow the downward passage of the products of combustion, substantially as shown and described, for the purposes specified.

2. The improved boiler-furnace and steam-generator, composed of the double-walled fire-box and boiler-section A A² *f*, a grate B, a surrounding wall C, having a series of ports *g*, a crown-plate and boiler-section, D D² an annulus J, having an opening *k*, a fuel-magazine 3 4 5 6 *m*, having connecting branches *n* at its base, and a chute for conveying fuel to the fuel-chamber, substantially as shown and discribed, to operate in the manner set forth, for the purposes specified.

265,981. EAVES-TROUGH HANGER. CHAS. L. PIERPONT, Red Wing, Minn. Filed June 30, 1882. (No model.) Issued Oct. 17, 1882.

Brief.—The lower end of the attaching strap is inserted in the bend of the cross strap and held by a wire passing through both, to the ends of which wire the supporting wire is secured.

Claim.—1. The herein-described hanger, consisting of strap A, cross strip B, having bend *a* and ears *b*, and wire C, all combined and operating as set forth.

2. In combination with trough D, the hanger consisting of strap A, cross strip B, having bend *a* and ears *b*, wire C, and supporting wire E, applied as shown.

265,992. STEAM GAGE COCK. MARQUIS D. L. SWANK, Jasper T. Thornley and John A. Awalt, Anderson, Ind. Filed Jan. 27, 1882. (No model.) Issued Oct. 17, 1882.

Claim.—1. The valve F, stem G, having apertures *g g*¹, and uncoupling-connections, combined with the casing A, having collar E with seat *e*, gland H¹, having annular recess H, the exit I, and operating means J L, as and for the purposes set forth.

2. The combination of the case A B C, having tube *a*, drip chamber N, and packing chambers O P, the exit I, and internal annular collar E, combined with the valve F, stem G, having ports *g g*¹, the gland H¹, having annular recess H, the cap-nut D, the separable lever J, and link L, all as and for the purposes specified.

266,015. SKYLIGHT AND VENTILATOR. WM. CONOLLY, New York, assignor to himself and John Seton, Brooklyn, N. Y., Filed Feb. 23, 1882. (No model.) Issued Oct. 17, 1882.

Brief.—T-bars of rolled iron, with sheet metal gutter portions attached below, are offset at the lower ends to fit the curb. The ridge piece is open from end to end and is covered by a damper, which overhangs, the whole being inclosed in a ventilating hood.

Claim.—1. The combination of the gutter piece consisting of two gutter portions and the interposed attaching portion secured to the lower portion of the T-bar, as specified and set forth.

2. The combination of the gutter piece consisting of two gutter portions and interposed attaching portion secured to the lower portion of the T-bar, and the covering cap attached to the ridge of the bar, as specified and set forth.

3. The combination of the ridge piece having an opening through it, the inclosing box and cap, and damper arranged to overhang the ridge piece, substantially as specified.

4. The combination, substantially as specified, of the rafters provided with an extension at one end of the flanges, bent at an angle to the body of the rafter, with the base-plate and curb.

5. The combination, substantially as specified, of the rafters provided with an extension at one end of the flanges, bent at an angle to the body of the rafter, with the base plate and curb, and with the gutters of the rafter.

266,017. SHEET METAL PIPE JOINT. JOHN Y. COOPER, Nashville, Tenn. Filed Aug. 11, 1882. (No model.) Issued Oct. 17. 1882.

Claim.—As an improvement in sheet metal pipe joints, the combination of two sections of pipe, one provided with a groove to receive projections on the other pipe, which projections will be entirely hidden from view when the pipes are adjusted together, and will lock the pipes from disengagement by force exerted longitudinally in either direction, said sections of pipe each having a seam arranged to tally with the seam of the adjoining section when the entirely hidden projections are at the point where they can be separated from the grooves, the sections being capable of complete revolution on each other to bring said seams together, all arranged and operating substantially as shown and specified.

266,026. DEVICE FOR TAPPING MAINS. GEO. RICHARDSON, Bridgeport, Conn. Filed Apr. 8, 1882. (No model.) Issued Oct. 17, 1882.

Claim.—The combination, with the cylinder or valve chamber, of the hollow screw cap A, having the drill guide B, projecting both above and below the top plate, and the nut *a* fitted on the screw-threaded upper projection of said guide, substantially as set forth.

266,046. STEAM HEAT AND POWER DISTRIBUTING APPARATUS. EUGENE F. OSBORNE, St. Paul, Minn. Filed Dec. 19, 1882. Renewed Sept. 14, 1882. (No model.) Issued Oct. 17, 1882.

Claim.—1. In a circulating steam supply system returning the water of condensation to the generator and extending to districts of unequal elevation, the combination, with the condense water return pipe, of automatic mechanism, substantially as described, for controlling the flow of water therein in opposition to the force of gravity due to the difference in elevation, substantially as set forth.

2. In combination with a pipe giving descent to the water of condensation in a steam supply circulation, the pressure regulator valve E, arranged in said pipe near the point of normal pressure, substantially as and for the purpose specified.

3. In combination with a condense water return pipe giving ascent to the water of condensation in a steam supply circulation, and with an adjacent steam supply pipe, a pump automatically operated by steam from said supply and connected to force the water upward in the return pipe, substantially as set forth.

4. In combination with the steam supply pipe having a reducing valve, E¹, and the adjacent water return pipe, disconnected at P at a low point thereof, a steam pump S, having its steam supply *s*, provided with an automatic valve S⁴, connected to open by the pressure of water in the return pipe below the point of disconnection, and its steam exhaust connected into the steam supply pipe beyond the valve E¹, having its water cylinder connected to receive from the return pipe below and to deliver into the same above its point of disconnection, substantially as described, and for the purposes set forth.

266,182. COCK. CHARLES H. GOODRICH, Stoneham, Mass. Filed Aug. 10, 1882. (No model.) Issued October 17, 1882.

Claim.—1. In a cock the barrel or casing having the fixed member of the plug-arresting stop, combined with the washer attached, as usual, to the plug, and serving to connect the latter to the barrel, and provided with the stud E or its equivalent, whereby said washer is enabled to serve as the movable member of said stop in addition to its usual function as set forth.

2. In a cock, the combination of a cylindrical plug, the barrel having the fixed member, of the top and the detachable washer having the movable member of the stop, and pins *p p*, entering orifices in the end of the plug, whereby independent movement of the washer is prevented, as set forth.

265,786. APPARATUS FOR THE ELECTRICAL TRANSMISSION OF POWER. THOMAS A. EDISON Menlo Park, N. J. Filed Aug. 7, 1882. Issued Oct. 10, 1882. (No model.)

265,790. ELECTRIC LAMP. MOSES G. FARMER, Newport, R. I., assignor to the United States Electric Lighting Company, New York, N. Y. Filed March 7, 1881. Issued October 10, 1882. (No model.)

265,792. PROCESS OF AND APPARATUS FOR MANUFACTURING GAS. THOMAS B. FOGARTY, Brooklyn, N. Y. Filed Mar. 14, 1882. Issued Oct. 10, 1882. (No model.)

265,793. PROCESS OF MANUFACTURING GAS. THOMAS B. FOGARTY, Brooklyn, N. Y. Filed Mar. 29, 1882. Issued Oct. 10, 1882. (No model.)

265,794. STEAM BOILER FURNACE. MICHAEL A. FOSTER, St. Louis, Mo. Filed June 29, 1882. Issued Oct. 10, 1882. (No model.)

265,834. FIRE-PLACE FRAME. JOHN J. LEBEAU and CHARLES L. SHANNON, Cincinnati, Ohio, assignor to the Eureka Co-Operative Foundry Association, same place. Filed June 21, 1882. Issued Oct. 10, 1882. (No model.)

265,870. HIGH AND LOW STEAM AND WATER ALARM. JOSEPH RICHTER, Cincinnati, Ohio. Filed July 31, 1882. Issued Oct. 10, 1882. (No model.)

265,871. WATER GRATE-BAR. MATTHEW L. RITCHIE, New York, N. Y., assignor to John B. Kitching, same place. Filed May 31, 1882. Issued Oct. 10, 1882. (No model.)

265,915. PROCESS OF AND APPARATUS FOR MANUFACTURING HYDROGEN GAS. WILLIAM H. BRADLEY, New York, N. Y. Filed Sept. 9, 1882. Issued Oct. 10, 1882. (No model.)

265,928. HYDROCARBON-BURNER FOR ILLUMINATING PURPOSES. RICHARD MCALLISTER, Washington, D. C. Filed Aug. 21, 1882. Issued Oct. 10, 1882. (No model.)

265,961. COMPOUND FOR FIRE BRICK, FURNACE LININGS, ETC. JAMES HENDERSON, Bellefont, Pa., assignor to Chas. G. Francklyn, New York, N. Y. Filed Apr. 6, 1882. (No specimens.) Issued Oct. 17, 1882.

265,982. STOVE PIPE DAMPER. WM. E. QUIGGLE, Dedham, Mass. Filed Aug. 21, 1882. (No model.) Issued Oct. 17, 1882.

266,010. BRICK FOR BUILDING ARCHES AND FURNACE ROOFS. WM. G. BELL, Allegheny City, Pa. Filed Mar. 30, 1882. (No model.) Issued Oct. 17, 1882.

266,014. VAPOR BURNER. FRANK M. CAMPBELL, St. Louis, Mo. Filed Apr. 7, 1882. (No model.) Issued Oct. 17, 1882.

266,019. ROTARY PUMP. WM. N. DE GROAT, Knoxville, Tenn., assignor of one-half to A. L. Maxwell, same place. Filed Oct. 21, 1881. (No model.) Issued Oct. 17, 1882.

266,026. STEAM PUMPING ENGINE. WM. M. FERRY, Park City, Utah. Filed Mar. 29, 1882. (No model.) Issued Oct. 17, 1882.

266,078. STEAM GENERATOR. WILLIAM BEESLEY and James Beesley, Barrow-in-Furness, County of Lancaster, England. Filed June 7, 1882. (No model.) Patented in England May 2, 1882, No. 2,074; in France June 27, 1882, and in Belgium June 27, 1882, No. 58,319. Issued October 17, 1882.

266,117. PUMP. JOSEPH P. ELLACOTT, Chicago, Ill., assignor to the Union Brass Manufacturing Company. Same place. Filed June 25, 1881. (No model.) Issued October 17, 1882.

266,143. COMPOUND FOR FURNACE LININGS AND FIRE BRICK. JAMES HENDERSON, Bellefonte, Pa., assignor to Charles G. Francklyn, New York, N. Y. Filed Sept. 4, 1882. (No specimens.) Issued October 17, 1882.

266,144. MANUFACTURE OF COMPOUNDS FOR FURNACE LININGS AND FIRE BRICK. JAMES HENDERSON, Bellefonte, Pa., assignor to Charles G. Francklyn, New York, N. Y. Filed Sept. 4, 1882. (No specimens.) Issued Oct. 17, 1882.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of the journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to the mid-of the sixth half-year from the date of the taking of last Census, that is, to March 1, 1883.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only mars the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

For the week ending February 10, of an urban population of 7,749,201 there died 3,254 which is equivalent to an annual death rate of 21.3 per 1,000, a slight decrease from the preceding week for which it was 21.7.

For the North Atlantic cities the death rate was 21.2; for the Eastern cities 22.8; for the Lake cities 17.9; for the river cities 21.6, and for the Southern cities, whites 22.4, colored 33.6 per 1,000.

For the four weeks ending January 27 the mortality rate for an average urban population of 6,814,270 was 21.8 per 1,000, a slight increase over the two preceding months. During this period of four weeks the average death rate in North Atlantic cities was 21.3, in the Eastern cities 23.4, in the Lake cities 18.2 in the river cities 19.7, in the Southern cities, for the whites 19.2 and for the colored 31.7 per 1,000. These figures may be compared with those for the months of November and December given in the Notes on page 133 of THE SANITARY ENGINEER for Jan. 11, 1883.

BOSTON, MASS.—C. E. Davis, Jr., reports 31 cases of diphtheria 20 of scarlet fever and ten of typhoid fever.

NEW YORK CITY.—The case of death from small-pox given in the table is reported by Dr. John T. Nagle as having arrived by schooner Archer and Reeves from Baltimore, Md., and died at Riverside Hospital Feb. 2.

NEW YORK CITY LUNATIC ASYLUM.—Dr. Franklin reports seven admissions, three discharges, four deaths and 1,325 remaining under treatment.

MILWAUKEE, WIS.—Dr. Diercks reports seven new cases of diphtheria and 15 of scarlet fever.

LOUISVILLE, KY.—Dr. Montgomery reports small-pox as "quite prevalent," but gives no estimate of the cases. Six deaths were reported from this cause during the week.

RAVENNA, PORTAGE CO., OHIO.—Scarlet fever continues to prevail in the town.

WHEELING, W VA.—Dr T. O. Edwards reports two cases of small-pox introduced into the city from Baltimore, Md.

Digitized by Google

DALLAS, TEXAS,—One case of small-pox proved fatal on Jan. 31. The health officer reports on Feb. 8 that there have been no other cases reported.

MOLINE, ILL.—Dr. L. D. Dunn reports four cases of small-pox as having been sent to hospital during the week.

YONKERS, N. Y.—Dr. V. Browne, Health Officer, reports four cases of diphtheria as having occurred during the week.

PITTSBURGH, PA.—Dr. Snively reports three cases of small-pox for the week ending Feb. 10.

SAN FRANCISCO, CAL.—Dr. J. Hoesch, Sec'y of Health Board, reports 115 deaths for the week ending Jan. 26, of which number 27 were in persons under five years. Accidents two, consumption 25, diarrhœa seven, diphtheria five, pneumonia 13, congestion of lungs two, bronchitis six and whooping cough one.

The report for the week ending Feb. 3, is given in the table above.

CHICAGO, ILL.—Dr. W. K. Gleason's report for the week ending Feb. 3 was not received in time for publication last week. Total mortality 232; under five years 97. Accidents ten, cerebro-spinal meningitis four, consumption 36, croup seven, diphtheria 21, erysipelas one, typhoid four, malaria fever three, scarlet fever six, pneumonia 16, congestion of lungs four, bronchitis 17, measles one, puerperal diseases six and small-pox four.

PROVIDENCE, R. I.—Dr. E. M. Snow reports the census taken Jan. 1, 1883 as giving the city a population of 116.755; males 55,736, females 61,019; families 25,977. The increase since 1875 is 16,080 or 15.97 per cent; since 1880 the increase is 11,898 or 11.34 per cent.

MICHIGAN.—Dr. H. B. Baker reports the following diseases in their order of prevalence as the principal causes of sickness during the week ending Feb. 3: neuralgia, bronchitis, rheumatism, consumption, intermittent fever, tonsilitis, pneumonia and influenza.

Diphtheria was reported present at 19 places, scarlet fever at 18 places, and measles at 17 places. Small-pox was reported at St. Joseph, Berrien Co., Feb. 3.

JACKSONVILLE, FLA.—Dr. A. W. Knight reports influenza as the prevailing sickness of the month of January, caused by unusually wet and cold weather. The large rainfall made it impossible to have the streets kept in their usual clean condition. The cleaning out of the mouth of a drainage creek in the city is urged as a preventive of malarial disease.

ONTARIO, CANADA.—The *Provencial Bulletin*, for the week ending Feb. 3, shows an increase in the diseases of the respiratory organs, which is believed to be largely due to the extreme weather of the previous week. Bronchitis, influenza, neuralgia, pneumonia, and rheumatism increased in degree of prevalence and tonsilitis in its area of prevalence. Diarrhœas continue. Diphtheria, which in November and December prevailed in the western district, is now prominent in other parts of the province. Small-pox is reported epidemic among gangs of railway men in the far North.

HAVANA, CUBA.—Dr. D. M. Burgess reports 551 deaths for the month of January. Yellow fever caused 14 of these deaths, typhoid fever eight, and diphtheria and croup five each. Four of the fatal cases of yellow fever occurred among private citizens, the remaining ten among soldiers and sailors in the military hospital.

During the first seven days of February one fatal case of yellow fever and one of small-pox were recorded.

AUX CAYES, HAITI.—Consular Agent Dutton reports for the weeks ending Jan. 6 and 13, small-pox is decreasing. There were five deaths caused by it in the former week and only two in the latter.

ST. THOMAS, DANISH WEST INDIES.—The report for the fourth quarter of 1882 shows 91 deaths, or 24.26 per 1,000 living per year. 30 deaths of children under five years are recorded. Typhoid and typhus fevers, pneumonia, puerperal fever, and violence caused each one death; bronchitis nine, consumption 13, diphtheria four, and diarrhœa nine. During the quarter the following cases were reported by the medical men: Small-pox, scarlet fever, croup, whooping cough, and erysipelas, none; measles two, diphtheria nine, typhoid fever two, dysentery 33, diarrhœa 96, puerperal fever one, malarial fever 128, catarrhs and bronchitis 46.

The Report for the year 1882 shows 480 deaths in the population of 15,000, giving a rate of 32 per 1,000. Deaths under five years, 181; births, 406, including 33 still-born. Of the 480 deaths one was caused by yellow fever (at quarantine), four by malarial fevers, four by typhoid and one by typhus fevers, 20 by measles, three by erysipelas, five by diphtheria, two by croup, 49 by bronchitis (acute), 58 by consumption, seven by pneumonia, two by pleurisy, one by puerperal fever, four by dysentery, 73 by acute diarrhœa, and six by violence.

Two cases of small-pox were introduced during the year, were quarantined, and did not spread. Measles were introduced by a French steamer with emigrants from Teneriff, and 164 cases were recorded, but these reports of cases by no means indicate the real prevalence of the sickness; thus, in one week, during which 16 cases were reported, the school director found 65 children absent on account of this disease.

PERNAMBUCO, BRAZIL.—Consul H. L. Atherton sends reports for the weeks ending December 25 and January 1, 8 and 15. Population 109,300. First week: total mortality 55; from small-pox nine. Second week: total mortality 53, of which eight deaths were caused by small-pox and one by yellow fever. Third week: total mortality 60; small-pox ten, yellow fever one. Fourth week: total mortality 51; small-pox ten, yellow fever none.

RIO DE JANEIRO, BRAZIL.—Deputy Consul-General Jas. H. Murray reports 225 deaths during the week ending December 30. Of these 32 were caused by small-pox, five by pernicious fever and 37 by consumption. Population 330,000.

TEHUANTEPEC, MEXICO.—Consul Jno. A. Sutter, Jr., of Acapulco, transmits an extract from a letter of January 2, from the Consular Agent at Tehuantepec which states that an epidemic of diarrhœal disease, introduced by troops from Tomala, has killed more than one thousand persons in about four weeks, but is now happily decreasing.

SCOTLAND.—The return of the Registrar-General for the week ending January 27 shows the death-rate in the eight principal towns of Scotland to have been 27.3 per 1,000, or 4.7 above that for the corresponding week of last year. The lowest mortality was recorded in Leith, 14.4; the highest in Dundee, viz., 33.8; in Edinburgh the mortality was 21.2. Whooping cough continues to be the most fatal miasmatic disease, the mortality from it being greatest in Dundee and Glasgow (20 fatal cases in each).

IRELAND.—Consul A. B. Wood, of Belfast, transmits the report of the Registrar-General for the week ending January 20, an abstract of which appears in our table.

In the Dublin District there were 165 deaths equalling an annual rate of 24.5. No deaths occurred from small-pox, measles, scarlet fever or diphtheria. Five deaths were registered from typhus and 11 from whooping cough.

In Belfast there were 145 deaths making a rate of 27.7. No deaths occurred from small-pox or diphtheria. Measles caused two deaths, typhus one, scarlet fever three and whooping cough five.

The Registrar-General's return for the quarter (13 weeks) ending December 30, 1882, shows an average annual death-rate of 27.5 in the Dublin Registration District and fifteen of the principal Urban Sanitary Districts of Ireland. Clonmel gave the lowest rate 15.4 and Wexford the highest 44.7

In Dublin the rate was 25.9; and of the total number, 2,258, of deaths two were caused by measles, four by scarlet fever, 23 by typhus, 50 by whooping cough, nine by diphtheria, 45 by enteric fever, 48 by diarrhœa and dysentery, 249 by consumption and 587 by diseases of the respiratory organs.

In Belfast the rate was 31.2 and the total deaths 1,620. Small-pox caused five deaths, measles 73, scarlet fever 135, typhus 14, whooping cough 29, diphtheria nine, enteric fever, diarrhœal diseases 52, consumption 187 and diseases of the respiratory system 455.

Measles caused high death-rates in Dundalk and Wexford.

PARIS, FRANCE.—The Bulletin for the week ending Jan. 25 records 1,112 deaths; males 614, females 498; under five years, 271, over 60 years, 262. Typhoid fever caused 56 deaths, small-pox 14, measles 11, scarlet fever two, whooping-cough seven, croup and diphtheria 42, erysipelas eight, consumption 216, acute bronchitis 41, pneumonia 79, and violence 25. Annual rate 25.80. On Jan. 21 there remained under treatment in the hospitals 66 cases of small-pox, 624 of typhoid fever, and 32 of diphtheria.

The night medical service of Paris is conducted by 658 physicians and 185 mid-wives. These were called 6,891 times during the past year; 2,476 times on account of sick men, 3,400 times on account of sick women, and 1,015 times on account of children. This service has been progressive. In 1876, the year of its establishmsnt, 3,616 visits were made, but the number rose in 1879 to 5,282, in 1880 to 6,341, and now in 1882 to 6,891.

RHEIMS, FRANCE.—Consul John L. Frisbie reports for the week ending Jan. 20, a total of 46 deaths, equalling an annual rate of 25.48 per 1000 living. The births numbered 70, not including three still-births. Diphtheria, measles, small-pox, typhoid fever and pneumonia caused one death each, acute bronchitis and bronchial catarrh six deaths, broncho-pneumonia two deaths, and consumption ten deaths.

LYONS, FRANCE.—Consul B. F. Peixotto reports 201 deaths during the week ending Jan. 13, which is equal to an annual rate of 27.7 as compared with an average of 24.8 during the previous five weeks. The increase is ascribed to catarrhal diseases.

MARSEILLES, FRANCE.—The monthly bulletin for December shows 973 deaths in a population of 360,99. Typhoid fever caused 47 deaths, malarial fever eight, measles 31, whooping cough two, scarlet fever one, small-pox 26, croup and diphtheria 40, consumption 116, bronchitis 23, pneumonia 149, pulmonary congestion nine, puerperal fever three and violence 18. Of the decedents 280 were under five years of age, and 252 were over sixty years. The births numbered 848. Small-pox, measles, typhoid fever and croup are reported as increasing in prevalence.

During the year 1882 there were 10,915 deaths; males 5,831, females 5,084, and 10,256 births, exclusive of 818 still-births.

BRUSSELS, BELGIUM.—During the week ending Jan. 20, 190 deaths occurred in the city and its *faubourgs* and 285 births, corresponding respectively to anuual rates of 36.2 and 24.3 per 1,000. Of the deaths 91 occurred in persons under five years of age. Small-pox caused three deaths, measles one, scarlet fever and diphtheria none, fevers (typhus and typhoid) three, croup two, whooping cough one, diarrhœal diseases 24, bronchitis and pneumonia 32 and consumption 29.

STOCKHOLM, SWEDEN.—Consul Elfwing transmits report for the week ending Jan. 13. Total deaths 95, males 50, females 45 under five years 49, over sixty years 16. Annual rate 28.4. Violence caused four deaths, bronchitis eight, pneumonia 17, consumption 13, diarrhœal diseases five, typhoid fever one, croup two, scarlet fever six and measles, four. No deaths are reported from small-pox, whooping cough or puerperal fever.

During the week ending Jan. 20 the following cases were reported: measles 57, scarlet fever 30, puerperal fever one, erysipelas three, whooping cough 17, diphtheria eight, typhoid fever six, diarrhœa 24, tonsilitis 23, pneumonia 18, pleurisy one, and acute bronchitis 117.

COPENHAGEN, DENMARK.—During the week ending Jan. 16, there were 131 deaths, under five years 67, over sixty 33. Measles, typhoid fever, dysentery and puerperal fever caused one death each, scarlet fever and diphtheria two each, croup and whooping cough three each, consumption ten, pneumonia nine and bronchitis 15.

During the same week the following cases were reported: Measles one, scarlet fever 30, diphtheria 17, croup three, whooping cough 62, typhoid fever four, diarrhœa 95, erysipelas 22, puerperal fever two, bronchial catarrh 554, pneumonia 53 and tonsilitis 134.

MADRAS, INDIA.—Consular Agent L. Strange, reports for the week ending Dec. 22. Total deaths 287, males 130, females 157. Annual rate 27.5. Small-pox caused five deaths, measles none, fevers 85, dysentery 29, diarrhœa 13, and cholera none.

BOMBAY, INDIA.—Consul B. F. Farnham reports that during the week ending Jan. 9, the deaths registered were 455, being 26 more than in the preceding week and 27 less than the mean of the corresponding period in the previous five years. There were 83 deaths from remittent fever, one from cholera, 79 from diseases of the respiratory system, 22 from diarhœa and 18 from dysentery.

COLUMBO, CEYLON.—Reports for the weeks ending December 16, 23, 30 and Jan. 6, show the cases of small-pox reported to have been respectively 24, 30, 24 and 37, and the deaths from this disease in the respective weeks one, two, six and six.

REGISTRATION OF BIRTHS, MARRIAGES, AND DEATHS.

To the Editor of THE SANITARY ENGINEER:

In your issue of Feb. 1 you say in your notice on the Second Annual Report of the State Board of Health, "With regard to the State system of registration of births, marriages and deaths, we are told that it is doing well, and that '947 towns, 326 incorporated villages, and 18 cities have been provided with methods of vital registration.' We should like to see a list of these towns, villages, and cities, a statement of the number of births, deaths, and marriages which they have recorded and reported, and also a list of those towns, villages, and cities which are not keeping such records." It is with pleasure that I notice such an indication of interest—which I hope is a growing one—which you evince in the matter of registration of births, marriages, and deaths.

The new law, though crude and deficient in many points, is, on the whole, a good measure, but it needs the proper officers and the people themselves to take an interest and help carry out this law. There is no use denying that this country is far behind other countries, and our State far behind other some States in this matter. The apathy and stolid indifference shown by physicians and clergymen, whose duty it is to make the returns, and the silly opposition exhibited by some individuals, who should see at a glance that it is for their own benefit, is little short of exasperating.

I would be greatly pleased to see the public prints take this matter in hand more than they do, publish the reports as they come out, keep the matter before the public mind, and urge their readers to see the necessity of not only complying with the law, but assisting in its fulfillment.

I need not here set forth the manifold benefits arising from an accurate and efficient system of registration, my time and your space would not permit, but the thinking mind will, I think, discern the numerous advantages, both of public and private import, to be derived from such a system.

Now, Mr. Editor, while thanking you for noticing the matter as above stated, may I make bold to ask you to continue doing so; and should any other of your readers be interested in this subject I should be only too glad to hear their views on it.

Yours truly, ELLIOT.

SUICIDES IN NEW YORK CITY DURING THE ELEVEN YEARS ENDING DECEMBER 31, 1880. By JOHN T. NAGLE, M.D., Cambridge, 1882. 15 pp., 8vo.

This interesting pamphlet is a reprint from the transactions of the American Public Health Association of a paper read before that body at Savannah in 1881. It appears that during the 11 years in question 1,521 deaths were registered in the Health Office as caused by suicide, 1,193 being of males and 328 of females; whites 1,518, colored three. It seems, however, that the register refers certain deaths to suicide which would certainly not be included under that head by most registers, since they were evidently accidental and not intentional.

The highest yearly rate of suicide in New York city during the past seventy-seven years was in 1805, when there was one suicide to every 3,017 inhabitants, and the lowest rate was in 1864, when there was one suicide to 23,827 inhabitants, Taking those races present in sufficiently large numbers to make the comparison of value, we find 626 suicides among the Germans, giving a rate of 34.49 per 100,000 for eleven years. The Irish furnish 213 cases, giving the rate of 9.71 per 100,000, and the United States 368, giving a rate of 5.61. Evidently the American is not so easily discouraged as the others.

The most common means used was poison, which is reported in 503 cases. Paris green was the poison most used, being the cause in 200 cases. Hanging was employed in 237 cases; cuts and stabs in 174; gun and pistol shot wounds in 395, and drowning in 99 cases. Tables are given comparing the rates in New York with those of other cities, both American and foreign, for the year 1880, but for the great majority the numbers are too small to have any statistical value. The smallest proportion of suicides is found in the Scotch cities taken altogether.

Digitized by Google

Dr. Nagle remarks that "in order to prevent or decrease suicides by poison and fire arms it will be necessary to restrict the sale by imposing severe penalties. In regard to the other means used for committing suicide, remedial measures will easily suggest themselves." We must say that they do not suggest themselves to us, and we have been unable to find others more fortunate. If there are any such it is time the two hundred and forty odd cities whose statistics are given were making use of them.

Dr. Nagle's study is a very interesting one, especially to those interested in Sociology and Ethnology, and it is to be hoped that he will continue his studies and favor us with more of the same sort, for which he must have ample materials.

SURFACE TEMPERATURES IN PARIS.—Edmond and Henri Becquerel have presented to the French Academy their observations upon the temperatures of the air and earth during the year 1880. They find that at the upper surface of the ground, when covered with snow, the temperature was maintained almost constantly in the neighborhood of—1° C., and did not fall below—1.5°, although the temperature of the air, as well as that of the upper surface of the snow, varied from—15° to 0°. The diurnal variations of temperature at the surface of the soil were perceptible under a mass of snow of .25 metre thickness (9.84 inches), but they never exceed a few tenths of a degree; moreover, the differences in the observed temperatures, at different depths in the snow, varied nearly in proportion to the depth. These results show that a bed of snow, when the temperature is below 0° C., has a feeble conductivity and behaves like a conducting body traversed by a calorific wave. Under a surface which is covered by turf, the variations are much more feeble than under a surface of gravel or loam. The network of rootlets constitutes an almost complete non-conductor. Each bed of soil is submitted to the influence of two calorific effects; one due to the variations of external temperature, the other to the action of the deep layers which tend to produce a constant temperature. The amplitude of thermometric oscillation which results from these complex effects when there is any disturbing influence, such as an infiltration of water, varies inversely with the depth of the bed.—*Comptes Rendus.* C.

THE PHYSICIAN AND THE DRUGGIST.

About a year ago Martin McIntyre, a Fonda druggist, put up a prescription for John Cook, written by Dr. Parsons, of Fultonville. The medicine nearly killed Cook. The physician claimed the prescription had been altered and commenced an action against the druggist for damages. The prescription called for one dram of podophyllin. Dr. Parsons claimed he had written it one grain, and that it had been altered by the druggist, to cover up his mistake. The case was tried last week. On the trial McIntyre swore the prescription had not been altered, and Dr. Parsons swore it had. Two experts testified that no alteration had been made. Another question in the case was whether or not the druggist was justifiable in putting up a prescription in which he noticed a dangerous excess of any ingredient. Judge Landen ruled that if the prescription of a regular practicing physician is put up as written, the druggist is not responsible. The jury decided that the prescription had not been altered, and therefore no cause for action.—*Utica Herald.*

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

Good Coffee

No. 41.

Roasted and packed in Pound Packages as a guarantee of genuineness (in the Bean, not ground). Ask your Grocer for Thurber's No. 41 Price 30 cents per Pound. Good Coffee is often spoiled in the making, therefore an approved Recipe is placed in every Package.

If you cannot get No. 41 Coffee at your Grocers, and desire to try it, send us a Postal Card and we will see that it is supplied.

Pure Sugar
vs.
Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

Employment Wanted.

Under this head we will insert advertisements, not exceeding four lines, free of charge, for persons seeking employment. This privilege is restricted to persons employed by *Architects, Civil Engineers, Chemists, Electric Light Companies, Gas Companies, Plumbers and those engaged in the business of Heating by Hot Air, Hot Water and Steam.*

A POSITION as Water Works Manager by a gentleman who can furnish good testimonials. Satisfactory reasons for desiring to change Address, B., care of THE SANITARY ENGINEER.

AN EXPERIENCED Steam and Gas Fitter wants a situation. Can give reference.
Address, 243 West 42d St., N. Y.

GOOD EXPERIENCED Plumber that can do Steam and Gas Fitting, wants a position.
Address, T. B., Office of The Sanitary Engineer.

A FIRST-CLASS Journeyman Plumber, with 14 years' experience wants a steady job. Has been employed on the work in W. H. Vanderbilt's house. Address, C., The Sanitary Engineer,

WANTED—SITUATION—As a practical plumber in a good shop; wages not as much an object as steady work. Address PLUMBER, No. 27 Joralemon Street, Brooklyn.

AN ENGINEER and Steam Fitter desires employment; competant to take charge and handle jobs.
Address, R. KINCHLEA, 448 West 36th St., N. Y.

A FIRST-CLASS Plumber, *recently* employed on the work in Mr. W. H. Vanderbilt's house, wants steady work in the South. Address "J. L. D." Office Sanitary Engineer.

STEAM FITTER; twenty years' experience in New York City. Good references. Does not object to go out of the city.
Owen F. MacMahon, 321 W. 15th street.

A FIRST-CLASS Plumber (12 years' experience) wants a position. Steady. City or country. References from the best master plumbers in the city. T. M., No. 321 E. 115th st., N. Y. City.

WANTED—Position by an experienced Book-Keeper. Refers to proprietor of this paper.
Address, M. E. S., care of THE SANITARY ENGINEER.

Proposals.

PRINCETON WATER WORKS.

OFFICE OF THE PRINCETON WATER COMPANY, PRINCETON, N. J., *Feb.* 10, 1883.

Proposals will be received at this office until noon of Tuesday, February 27, 1883, for the construction of a well, engine-house and boiler-house and chimney and for foundations for a tower, and for laying water pipes and appurtenances for the Princeton Water Company, in accordance with the plans and specifications for the same on file in this office. All proposals must be itemized in accordance with the plans and specifications for the same on file in this office. All proposals must be itemized in accondance with the classification prescribed by the Company, and no proposal for doing the work for a gross sum, irrespective of items, will be considered. The Company reserves the right to reject any or all proposals if they are not satisfactory. The plans and specifications may be seen and blank forms of proposals procured at this office, and also at the office of the engineer, J. J. R. Croes, C. E., 63 Bleecker street, New York City. Any person to whom a contract may be awarded will be required to execute a bond with satisfactory security for the amount of 50 per cent. of the estimated cost of the work. The work is to be begun at once, and completed by July 1, 1883.

WILLIAM LIBBEY, JR.,
Secretary Princeton Water Co.

PROPOSALS FOR BUILDING A STEAM PROPELLER FOR THE QUARTERMASTER'S DEPARTMENT.

DEPOT QUARTERMASTER'S OFFICE, CORNER HOUSTON AND GREENE STS., NEW YORK CITY, *Feb.* 5, 1883.

Sealed proposals, in triplicate, with a copy of this advertisement attached to each, are invited, and will be received at this office until 12 M., March 7, 1883, at which time they will be opened in the presence of bidders, for the construction of a steam propeller for the United States Quartermaster's Department, for service at Fort Monroe, Virginia. Bids are invited to be made for the vessel complete; also for that portion embraced in specifications No. 1, or that in No. 2, or that in No. 3, only, or those portions in any two of them. Plans and specifications of the same, together with all other necessary information, will be furnished to bidders on application to the Chief Quartermaster on Governor's Island, New York Harbor, the Depot Quartermasters at Washington, Baltimore, Philadelphia and Boston, the Post Quartermaster at Fort Monroe, Virginia, and at this office. Bids are also invited for the work on the basis of supplying out-board condenser, 6-inch, No. 8 copper, or ¼ brass. Also on the basis of the Government supplying the circulating and air pump, and a condenser of one-half the required capacity, the contractor furnishing the other half and making all connections. In either case, if award is made thereon, the specifiations will be changed accordingly. The right is reserved, on the part of the United States, to reject any or all bids. Proposals should be endorsed "Proposals for Construction of Steam Propeller," and addressed to the undersigned.

HENRY C. HODGES,
Deputy Quartermaster-General, United States Army.

THE SIXTH VOLUME OF

HE SANITARY ENGINEER.

he sixth volume of THE SANITARY ENGINEER includes 27 issues from June 1 to Nov. 30.

he following are a few of the many articles of perma- interest:

lustrated descriptions of the plumbing work in the well- wn residences of Messrs. Wm. K. Vanderbilt, Cornelius derbilt, Ex-Gov. Samuel J. Tilden, John Sloane. of the "Mills Building" (the largest office building in York) and Minot, Hooper & Co.'s Commercial dings. A Russian Bath Establishment in Boston and St. James Hotel in Baltimore.

Berlin Sewerage." An elaborate report of the system completed, with illustrations. By M. A. Durand- e, Engineer-in-Chief of Bridges and Roads of Paris.

Trap Syphonage." Report with illustration of experi- ts for National Board of Health. By Edw. S. Phil- k and E. W. Bowditch. Also by Col. Geo. E. Waring, Also in England by S. S. Hellyer, Esq. Interesting valuable data.

Coverings for Steam Pipes." Results of Some Experi- ts. By Mr. M. J. Bird.

The Health of Boys' Boarding Schools." By D. F. oln, M.D.

eekly "Mortality Returns" of the leading cities in United States, with "Notes and Abstracts" from re- of Health Officers and correspondents of the National d of Health. There have been printed each week be- ing with issue of Oct. 12.

Tin in Canned Fruits." By Prof. Albert B. Prescott.

Negro Mortality of Memphis." By Dr. G. B. Thorn-

Pullman Sewerage." Abstract of paper describing it. enezette Williams, C.E., Engineer in charge.

Letters to a Young Architect on Heating and Ventila- " By Dr. J. S. Billings, Surgeon, U.S.A.

model plan for an "Improved Tenement for Working in New York."

Burning of Town Refuse at Leeds. A paper by Chas. , Assistant C.E.

The Relative Uses of Gas and Electricity." By C. Siemens, F.R.S.

Heat, House Plumbing and Mortality." By Lewis Leeds.

The Management of Heating Apparatus." By Edw. ilbrick, C.E.

extract from a paper by S. S. Hellyer on the "Un- g of Traps by Momentum"—interesting in connec- with experiments made by Messrs. Philbrick and litch, and Col. Geo. E. Waring.

Water Waste Prevention."

Regulation of Exeter Water Works." A paper by I. Deacon, M. Inst. C.E., read before Society of

Report of Boston Committee," and report of results in nnati.

The Massachusetts Law to Prevent the Adulteration od and Drugs."

Notes on Prosecutions in Great Britain."

actical articles on "Steam Fitting and Steam Heat- by "Thermus."

illustrated article describing the "Accommodation e Foreign Cattle Trade" at the port of Liverpool. rancis Vacher, M.D.

n of "Flush Tank for Country Residences."

Text of the Illuminating Oils Bill for New York "

The Effect of Water Level on Disease." By Bald- Latham, M.Inst., C.E.

Form of Specification for Steam Fitting of an Eight Apartment House."

Report on Oil Testers."

article on the "Sewerage of Brighton, England." reports by Sir Joseph Bazalgette and J. Bailey Den-

series of papers on "Water Analysis," from the yst.

Lead Poisoning." By Dr. Edw. S. Wood, Harvard cal College.

addition to the foregoing, there are answers to a great y of questions on the various topics treated by THE ARY ENGINEER, the usual record of patents granted e weekly reviews of questions of current interest to rians, and of the condition of the Gas and Electric Industries. This latter feature makes the paper of alue to inventors, since the aim is to state the facts ut bias for either interest. Price, bound in cloth, $3. ge 40 cents. P. O. Box 3037. THE SANITARY EN- R. No. 140 William St., New York.

The business manager of THE SANITARY ENGINEER begs to announce that he has established a Book Department for the sale of books treating on subjects in which the readers of that journal have a special interest.

Orders for books are therefore solicited. Address,

EALERS IN SUPPLIES OF EVERY DESCRIPTION,
28 PLATT STREET, NEW YORK.

ENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED,)
TE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not nave to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

"THE DU BOIS" TRAPS.

These Celebrated Traps are made in the same way as lead pipe—Sound and Smooth, Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

The "National" Patent Side Outlet Closet and Trap.

WITH IMPROVED FLUSH. (Registered).

Made either complete in one piece of Earthenware, or in two pieces with Basin and Trap separate.

An important alteration has been made in the *flushing* arrangement of this closet. The *supply* is now placed *opposite* the *outlet*, and a *new registered fan* attached which makes the closet more effective, and with less than two gallons of water it is guaranteed to perfectly flush out the soil and thoroughly wash the inside of basin.

The Most Cleanly, Durable, Effective and Cheapest Closet and Trap ever used, requires no fittings nor Machinery of any kind, and cannot get out of order.

For the perfect working of this closet a supply pipe not less than 1¼ inch must be used.

MANUFACTURED BY THOS. TWYFORD, HANLEY, STAFFORDSHIRE, ENG.

Sole Agent for the Manufacturer, E. ASPINALL, 206 Pearl Street, New York.

PLUMBERS' AND SANITARY EARTHENWARE OF ALL DESCRIPTIONS.

Illustrated Catalogue and Prices Furnished the Trade on Application.

SECTIONAL VIEW OF VALVE.

BENNOR

Syphon Trap

Will recommend itself to

Architects, Plumbers and Sanitary Engineers.

Because; First—It is a perfect seal under all circumstances, with or without water.

Second—By the peculiar construction of the valve in connection with its syphoning force, the trap and adjoining pipes are kept clean and free of coating.

Third—It cannot become clogged.

Fourth—It is simple, durable, cheap and easily adjusted.

BENNOR SYPHON TRAP CO., LIMITED.

17 North 9th St., Philadelphia, Pa.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

Address,

THE SANITARY ENGINEER,

P. O. 3037. 140 William Street, N. Y.

TWO years ago the undersigned introduced to the trade in this country THE ROYAL PORCELAIN BATH.

Prior to that period it was little known, except to those Americans who may have seen them when traveling in Great Britain; while it is true that they had been used there for 25 years, and were universally conceded to be the finest thing in the way of a Bath Tub known, yet, like all things supposed to be new and of high cost, they required extensive advertising to secure their acceptance and use to any considerable extent in the United States.

The effect of numerous expressions of opinion, made without either knowledge or experience to justify them as to their durability and utility, had to be counteracted, yet, as a result, we have succeeded in having them selected for some of the most elegant residences that have been erected within the past ten years. They have also been used in several hospitals, for which places we make a special, less elaborate, and cheaper class of fittings.

A personal inspection will convince any one of their superiority. Their increased cost over that of an ordinary copper-lined bath tub should not be a consideration to those who can afford to live in a house worth over $15,000, and would not be if their cleanliness, inviting appearance and durability was appreciated.

MEYER, SNIFFEN & CO.

46 & 48 Cliff Street,
New York.

N. B.—We have imported a line of sinks, which are made of the same non-absorbent material as the ROYAL PORCELAIN BATH TUBS. They are admirable for Hospitals. They have been used in some of our elegant New York residences, where their expense was no objection. They are one and one-half inches thick, and are less likely to be broken than cast iron. We have a size in stock that would make an admirable "Foot Bath."

THE BRIGHTON.

There is a tendency in some quarters to demand a Hopper form of Water Closet and to dispense with what are called mechanical parts. This would be desirable, if the so-called mechanical parts did not secure advantages in the matter of a large body of water in the bowl, not otherwise obtainable, without resorting to methods not everywhere applicable or sufficiently demonstrated as practicable.

The Brighton Closet here illustrated is, we believe, the best compromise yet devised between the Hellyer form on the one hand and the Hopper on the other.

By examining the sectional cut, it will be seen that the bottom of the bowl is covered with water, while the flush and shape of the bowl is such that the trunk on the back is kept clean.

It is attractive in appearance, being all in one piece, of white earthenware.

The pipe *B*, connected with the trunk, can be run into a heated flue when desired.

These Closets have had a large sale in England during the past four years. We have had them in use in our factory nearly two years—and we now offer them to those who prefer a different form of Water Closet than the *Hellyer, which, by the way, does not, in a single instance, so far as we know, fail to satisfy those who have them in use.*

This will be known as

"Meyer, Sniffen & Co.'s Water Closet Apparatus No. 30."

Persons interested are invited to call at our warerooms, Nos. 46 and 48 Cliff Street, New York, or at No. 1 Pemberton Square, Boston, and examine this and other specialties that we have fitted up with water attached, including THE ROYAL PORCELAIN BATH, THE MODEL PORCELAIN SLOP HOPPER, THE HELLYER CLOSET AND HOPPER, THE HOADS HOPPER, DOHERTY SELF-CLOSING COCKS, FULLER FAUCETS, etc.

DEMAREST'S

Patent VALVE WATER CLOSETS,

MANUFACTURED BY

THE J. L. MOTT IRON WORKS,

Nos. 88 and 90 Beekman Street, New York.

We take great pleasure in calling the attention f our customers and all interested in fine sanitary ork to the "Premier" water-closet, which is in all espects the same as our "Hygeia" Cistern Closet, nly it is fitted with a large Valve (one inch water-ay) suited to all pressures.

The valve is of the simplest kind, reliable and perfect in operation; it is positive in action, being operated by lever as shown in cut. The flushing rim ensures the wash of every part of the closet, and what is a most important feature, this is accomplished almost entirely without noise.

THE "PREMIER."

SIDE-OUTLET VALVE CLOSET.

THE "DEMAREST."

SIDE-OUTLET VALVE CLOSET.

The "Demarest" is undoubtedly the most popular closet of the kind in the arket. Its large and largely increasing sale being proof of its superiority where a st-class article is required at a moderate price.

THE "CLIMAX."

DIRECT-OUTLET VALVE CLOSET.

The above is a very reliable direct-outlet closet, and has given good satisfaction wherever it has been used. The outlet is full four inches, which is an important feature in this style of closet.

We furnish Enameled Iron or Imported All-porcelain Slop Safes to fit all the above Closets.

COMPLETE ILLUSTRATED CIRCULARS WITH PRICES, SENT ON APPLICATION.

ALL OUR SANITARY SPECIALTIES ARE FITTED UP WITH WATER ATTACHED,

And may be seen at our Warerooms, Nos. 88 and 90 Beekman Street.

British Subscribers who wish to receive this paper, without interruption should renew their subscriptions a month before expiration, with Messrs. E. & F. N. Spon, London, in order that they may be able to notify the Publisher, in New York, of the fact.

NOTICE.—Correspondents will prevent needless delays and annoyance if they will address all communications, except those of a strictly private nature, to THE SANITARY ENGINEER. Checks should also be drawn to the same order.

THE NATIONAL BOARD OF HEALTH IN CONGRESS.

The Congressional Record of Feb. 21 contains the debate in the House of Representatives upon that part of the Sundry Civil Service Appropriation Bill where the appropriation for the National Board of Health ought to have been, but was not.

The attack upon the Board was made by Mr. Ellis of Louisiana, as the mouthpiece of the Louisiana State Board of Health and of the Marine Hospital Service. He alleged useless extravagance on the part of the Board, more particularly in regard to the investigations which they set on foot in regard to the causes of disease, and in proof produced what he stated was a record taken from their own books showing the items of expenditure. This record, he said, had been furnished him by a member of the Board, but he subsequently said that he gave it on the authority of the Surgeon-General of the Marine Hospital Service. He brought up the old charge that the Board attempted to create the belief that yellow fever existed in New Orleans when that city was in perfect health, and denounced the system of inspection which was established there to prevent the commerce of the Valley from being interfered with. He was replied to by Mr. Dunn and others, who showed the absurdity and incorrectness of his statements, but under the lead of Mr. Hiscock, the Chairman of the Committee of Appropriations, the House refused to make an appropriation for the Board.

As the House is organized, this was a foregone conclusion several months ago, and the various petitions which have been pouring in from State Boards of Health and Sanitary Associations during the winter do not seem to have had the slightest influence.

It cannot be supposed that Mr. Ellis is so grossly ignorant, as his attempt to ridicule such important work as that of Prof. Mallet in water analysis would imply, and we must therefore conclude that this attempt, together with his sentimental rhodomontade about the Angel of death, etc., was a piece of pure demagogism intended for local effect to secure the backing of the New Orleans Board in the next election.

Taking them altogether the investigations made under the direction of the Board have been of great value, and no expenditure has ever been made by the United States to better advantage than that of the comparatively small sum paid for them. We print elsewhere extracts from the debate, and call particular attention to the remarks of Mr. Manning and Mr. King.

Instead of appropriating money for the use of the Board, the House voted to allow $100,000 to be expended under the direction of the Marine Hospital Service in case of epidemic.

We print elsewhere a statement by Hon. Thomas Carson, the Mayor of Brownsville, Texas, which shows how this fund is likely to be used. No matter how desirous the officers of the Marine Hospital Service may be to do the work in the best possible way, it is evident that the Custom House officers will control the appointments, and that in doing this they will be governed mainly by political considerations. The Brownsville cordon cost about twice as much as all the scientific investigations of the Board put together, and it is extremely doubtful, to say the least, whether it did any good. Certainly the methods employed were very different from those recommended by the sanitary authorities of this country or of Europe.

It is to be hoped that the Senate will correct this blunder of the House, and insist that the appropriotion of $100,000 to be used in case of epidemic, shall be placed under the direction of the National Board, or be stricken out altogether.

THE CHARGES AGAINST THE DEPARTMENT OF PUBLIC WORKS.

The letter from the Commissioner of Public Works to the Mayor, which we publish in another column, sustains the position which we took in July last (page 162) when the charges to which the Commissioner refers as having been made before the Mayor's Water Committee, were presented in one of the daily papers. We then expressed the opinion that only a fool would trifle with the water supply, and take the chances of doing irreparable injury, for the sake of getting an opportunity to oversee the expenditure of a few millions of public money, and that "the measures necessary to produce a deficiency cannot be taken without the connivance of so many persons, holding positions of trust, that their detection in case of an investigation would be certain, and would consign all persons involved to such infamy, that it is impossible to believe that they would be taken by anyone of ordinary foresight and regard for his own reputation."

A few days ago some persons laid before the Mayor's Committee some questions to which they requested the Commissioner of Public Works to give answers. These questions were so absurd in themselves, and displayed such an utter ignorance of the rudiments of natural philosophy and of practical common sense that the Committee and Commissioner of Public Works would have been perfectly justified in declining to pay any

Digitized by Google

attention to them. But Mr. Thompson has seen fit to treat the matter with an amount of consideration which we consider uncalled for, and asks the Mayor to make an official and thorough investigation of the flow of water in the aqueduct between High Bridge and the 92d street reservoir, and satisfy himself whether or not there are many millions of gallons surreptitiously abstracted between these points. Under the circumstances we hope his request will be granted, and that the examination will be made, and made thoroughly, and the result printed, with diagrams and explanatory remarks. It might put a stop, for a little while, to the frantic assertions that the Commissioner of Public Works is not only an astute knave but also a drivelling idiot.

We are not in sympathy with all the ideas and many of the methods of this department. We believe that it, in common with other city administrative offices, is managed with too much regard for political expediency and too little for the public welfare. We think it highly probable that a good deal more could be done in the way of preventing waste of water, than is doing, or has been done, and without more expense to the public. Yet, we must protest against such senseless abuse of any official, as has been lavishly spread before the Water Committee, without a single fragment of evidence to sustain it.

This, which has, to a certain extent, been forced upon the Mayor's Committee, is the only side issue they should meddle with.

That New York needs a better managed system of water distribution is manifest. That it needs an additional supply is evident to all who have examined the subject. Let the Committee, then, prove to their own satisfaction and that of other fair men who know no more of the laws of flowing water than they do, that the aqueduct is now carrying all the water it can, and they will be ready to report on the first question submitted to them, viz.: Is more water needed?

Then let them consider how the additional water shall be procured, not whence shall it come, for that involves the consideration of too many technical questions for a body without either scientific or legal advisers, but what organization will be the most efficient and will best protect the public interest, by whom should its members be chosen, and to whom should they be directly responsible, are questions quite proper for their consideration and upon which no collateral issues should be permitted to delay their report.

That matter being settled the problem of distributing the present supply, how it can best be utilized and conserved, pending the introduction of a new supply, might with advantage be looked into by a committee whose report would secure public confidence. A portion of this committee should be men who have held administrative positions, and others should be those who by education and occupation are familiar with the technical questions involved.

WHAT ARE YOU GOING TO DO ABOUT IT?

The calamity of the parochial school in Fourth street, by which sixteen children were killed and a number of others injured, is one which calls forth the usual comments from those who are responsible for the condition of things which made such an occurrence possible.

There was a narrow, steep, and comparatively dark, staircase with a frail baluster. An alarm of fire was given—there was a rush—the baluster gave way on the second story—further details are unnecessary.

It is reported by the daily press that the Directory are astonished at what has happened, and deeply regret it, and that the church to which the school belonged will provide burial for those children whose families are unable to pay the undertaker's expenses. It is to be feared that the mothers of these children will find small consolation in this. It is easy to moralize over the matter; to show how faulty was the construction; how careless were the directors; how ignorant or inefficient the inspector of buildings who approved such a construction; to point out how many other school buildings are in the like dangerous condition, etc. It is also well to remember that such moralizing, like most other easy work in this world, does very little good. There are not in this city of New York half-a-dozen school houses that are properly arranged and constructed with reference to the health and lives of their occupants. So much we ascertained several years ago in connection with our competition for plans for a model school house. But the school commissioners and their architect are satisfied; they do not anticipate any trouble, and will, no doubt, deeply regret what they will describe as an unforseen accident when it occurs. Is there any way by which such officials can be made wise and prudent, and fitted for the heavy responsibilities as regards the health and lives of the coming generation which devolve upon them? If there is we do not know it. Solomon took much the same view of the situation when he remarked: "Seest thou a man who is wise in his own conceit, there is more hope of a fool than of him."

NEW YORK'S WATER SUPPLY.

No. VI.

THE SUPPRESSION OF WASTE.

(Continued from page 226.)

Having in our previous article explained the details of the house-to-house inspection of water fittings as practiced in Manchester, we will now describe the methods adopted in the examination, testing and stamping of fittings.

As before stated meters are used in all buildings except dwellings. The following is the plan adopted in the testing of the meters:

There are two tanks, one holding 110 gallons and the other 180 gallons. On the front of the tank is a glass tube like a thermometer glass; the water line indicates on this tube the exact quantity in the tank. The meter is first tried by letting a hundred gallons run through as quickly as possible. The other test is to allow it to pass through in a period of ten hours. As the quantity passed by the meter in either case is known, the reliability of its record can be ascertained.

It has been stated that the receipts from fees for stamping fittings, together with the additional rates collected for uses to which water is put, discovered only by the house-to-house inspection, pay the entire cost of maintaining the waste preventing staff. The following scale of charges may, therefore, be of interest: For bibbs and stop cocks, two-pence each; ball cocks, three-pence; cisterns, six-pence; water closets. six-pence.

Three men do all the testing in Manchester, and they approve and stamp on an average about fifty thousand fittings in a year, which includes bibbs, stops, cisterns, water closets, stopcock valves, and any fitting used in the distribution of water. A portion of these stamped fittings are used in other towns in England, the practice being that smaller places that cannot afford to maintain a testing office require that fittings used in connection with their water supply shall bear the Manchester, Liverpool, or Glasgow stamp, or that of any other city whose stamp is a guarantee that the article is reliable. By this means it will be seen that other places contribute something towards the support of the testing office.

The rejection of fittings at the present time, after, of course, a number of years' inspection, is about as follows: the four leading makers, about five per cent., the others about 12 per cent. Most of the rejections are due to imperfect seatings, it being understood that compression or screw-down cocks are required; sand holes, also, are a very considerable cause of rejection. The former defect is revealed by taking the tap apart; the latter by the pressure test, which is 300 pounds to the inch.

Ball cocks have the size of the ball and length of the lever prescribed. They are tested by turning them upside down and placing a half pound weight on the ball, and then subjected to a hydraulic pressure of 150 pounds to the inch, which is regarded as equivalent to three hundred pounds when the ball is floating. The lever is stamped at both ends to prevent a plumber from shortening it. Waste-preventing cisterns are carefully examined and care is taken to see that the valves are so hung that they cannot both be suspended or off their seats at the same time.

The fittings are usually sent by the dealers in quantities to the testing office, as the plumbers will not buy them unless stamped, except in the case of an odd fitting required for special work, which the plumber, to save time, sends direct.

Taps are first weighed singly; if of requisite weight they are then taken to pieces, and a gauge is used to ascertain that the seat allows a good bearing for the washer. It is also examined to see that the thread is sufficiently long so that the stem will fit well in the cap and not wobble. Any deficiency in either of these particulars secures the rejection of the tap. The stamping of the maker's name on the tap is not insisted on, and with well-recognized makes every tap is not taken apart.

Doubtless the attempt to enforce similar rules in this city would provoke strong remonstrances from dealers and plumbers, who might at times feel annoyed at the restrictions. The former, especially, would have to find other markets for inferior goods and undoubtedly would make the strongest opposition. In this connection, therefore it may be well to recall the statement of a leading plumber in Manchester, who, when asked his opinion of the rules and their working, replied that through oversight of his workman, and failure to report changes made, he had several times been fined; that at first he had felt much annoyed at being obliged to wait to get special fittings stamped, yet, after his years of experience, he was bound to admit that his punishment had been deserved, was just and proper and that were he a water works engineer, entrusted with the duty of serving the public by preventing the waste of their water, he should do just as the authorities of Manchester did.

[TO BE CONTINUED.]

The meeting of the State Board of Health of New York in this city, last week, a report of which is elsewhere given, was an important one in several respects. Manufacturers had expressed considerable dissatisfaction at some proposed rulings with regard to mixtures. The Board therefore wisely and promptly decided to hold a special meeting in New York in order that manufacturers could confer with them. This was done, and all sides of the question were discussed, and as a consequence, the Board promptly showed their disposition to exercise the discretion vested in them by subsequently passing resolutions that embodied substantialy the views of the majority of those that expressed themselves on the subect. One important fact was made plain, and that was the necessity for the law.

A manufacturer who frankly stated that he was talking "business," and that this was "dollars and cents" to him, and that if the law was enforced as it was proposed, he would have to transfer his business to another State, contended that he thought it a hardship that he could not make and sell to ship owners a mixture as coffee in which no coffee was present, but which was given to sailors for coffee, said stuff selling for seven cents a pound; when asked if there was anything stimulating or nutritious in this compound that was for sailors exposed to wind and weather, he said, "Oh, yes. Why, I sell it to some of 'the public institutions of this city,' and the inmates are 'able-bodied and hearty.'" Fortunately, and to the credit of the merchants present, this gentleman's views were not endorsed.

The rulings made are such that while the purchaser is protected, no needless restriction is placed on legitimate trade.

Now, if further exemption is wanted, let manufacturers make their wishes known to the Board and we are satisfied that reasonable and proper requests will be fully considered.

SANITARY ARRANGEMENTS IN THE HOME FOR AGED FEMALES.

HOT WATER SUPPLY.

The building designed for a "Home for Aged Females," now in process of construction at the corner of 104th street and 10th avenue, contains some features in the plumbing work which we think will interest many of our readers. The building is of brick, four stories high, with basement and cellar. It is about 135 feet long by 45 feet deep, with a wing 28 x 40 feet at each end. It has about 90 rooms and is intended to accommodate about 100 persons. Mr. R. M. Hunt is the architect and Mr. John Toumey the plumber.

In the present article we shall consider the water supply, particularly the system of hot water distribution. We may subsequently describe other parts of the plumber's work, and possibly the heating and ventilation.

The supply from the street is through a 3-inch iron pipe, which, after passing a meter, goes directly to a steam pump, which supplies, through a 2-inch pipe, an iron tank of about 1,800 gallons capacity at the top of the house. From this point the system may best be understood by reference to the accompanying drawings, which show most of the pipes.

The large drawing represents the hot water reservoirs or boilers and connecting pipes. The reservoirs are of iron (painted), each of about 450 gallons capacity, and the pipes, like all the water supply pipes in the house, are of galvanized iron. The reservoir marked *a* is supplied directly from the street pressure through the 2-inch pipe *c*, which is a branch of the 3-inch pipe from the street to the pump. This, in turn, has branches, *d*, *d*, to fixtures in the basement and on the first floor. The reservoir *b* is supplied from the tank through the 2-inch pipe *e*. The two supply pipes *c* and *e* are connected in front of the reservoirs by a 1½-inch pipe, *f*, which has on it, beside a stop valve, a check valve opening toward the tank. When the street pressure exceeds the tank pressure this valve will open and admit water to the tank boiler direct from the street. It also opens a communication to the tank through the down supply pipe *e*. The upper part of this pipe connecting with the tank is shown in the smaller drawing. The check valve *c* closes toward the tank, preventing the admission of water from the street through the down supply pipe, in order to prevent waste, for nothing would stop the flow, and after the tank was full the water would be lost through the overflow. But to enable the street pressure to supply the tank without loss, when the pressure is sufficiently great, a branch, *b*, is taken from the down supply *e*, carried up over the tank, and a ball cock placed on its end. In this branch, over the tank, a small pipe, *d*, is inserted, which is always open to provide for relief in case of any expansion when the ball cock is closed. The supply pipe from the pump is marked *a* in the smaller drawing. There is a ¾-inch tell-tale pipe from the tank to the engineer's sink in the cellar, having a funnel-shaped opening at its upper end. The overflow is 4-inch upon the roof. This also has a lead funnel in the tank, measuring about 10 inches across the top.

To return to the larger drawing, the supplies to the two hot water reservoirs are also connected by a 1½-inch pipe, *g*, below the other, to provide for the supply of the street pressure boiler from the tank in case the former supply temporarily fails. The water is heated by a flat (horizontal) coil of 1¼-inch steam pipe placed in about the middle of each reservoir. These coils will be connected with the return pipes from the coils used to heat the air for the rooms in winter, and from the elevator in summer, since they are expected to furnish sufficient heat for the purpose. It is not desired to heat the water to a very high temperature, since a return circulation system is used, and no provision is made for direct relief for expansion and steam. If the hot water pipe had been extended up over the tank as is usual, the hot water would have escaped into the tank, since the street pressure now rises to that height during a large part of the time.

HOT WATER RESERVOIR AND CONNECTING PIPES IN HOME FOR AGED FEMALES.

The street pressure reservoir, *a*, is arranged to supply directly only as high as the first floor (through the 1-inch pipe *h*). The tank pressure reservoir, *b*, supplies the fixtures above the first floor through the 1½-inch pipe *j*. But these two pipes are connected by a 1½-inch pipe, *k*, so that either reservoir may supply the fixtures immediately connected with the other. The return circulation pipe, *l*, to the street pressure boiler is ¾-inch, and that to the tank boiler (*m*) is one-inch. The 1½-inch iron pipe *n* is for emptying the reservoirs into the house drain.

Most of the fixtures are at one end of the building, about 100 feet distant from the hot water reservoirs. The connecting pipes are carried through the cellar, suspended from the ceiling. The branches going to the left are to the laundry, which is in the wing at the opposite end from the kitchen, the water closets and the baths.

An anecdote that falls in with what we said a few issues ago about the air supply to furnaces was related by a well-known sanitarian at a public dinner last week. He had once examined a building in the near vicinity of New York when he found that the janitor had carefully closed the valve in the cold air pipe to the furnace, and turned the pipe into a chicken coop. As the speaker pointed out, ignorance of the simplest details of house construction, like this, on the part of those in command of them, is responsible for a good deal of the foul air.

END OF HOUSE TANK, WITH CONNECTING PIPES.

PROGRESS OF THE PLUMBING ORDINANCE AT PHILADELPHIA.

The committee of twenty-one appointed some time ago by the Survey Committee of Council to devise a code of sanitary laws and regulations held a meeting on February 21st in the Survey Department of the Public Buildings, Mr. J. J. Weaver presiding, and fifteen members present. Two ordinances were presented, one of which was prepared by Chief Engineer Smedley, of the Survey Department, and had been approved by the master plumbers; it put the matter of sanitary regulation under control of the Survey Department, while the second, presented by the Architects of the committee, provided for the forming of a Sanitary Commision Board to be composed of five physicians, five plumbers and five architects, and it shall form a division of the Board of Health. The architect's ordinance provides that the commission shall appoint eight inspectors; the latter ordinance is based on the acts in force in New York and Brooklyn. The committee seemed to favor the forming of the commission and the inspectors.

ATLANTIC COAST RESORTS.*

(Concluded from Page 268.)

In General.—The watering places on the Atlantic Coast of New Jersey are all more or less in a transition state—few have adequate water supplies and none are supplied with sewers. The plumbing is for the most part poor in planning and construction, but the maintenance. as a rule is good, while some is excellent. Without exception hotel-keepers and others express a desire to have their premises in good order, both inside and out if a way were but pointed out.

Many of the towns and villages have large populations, and their sanitary condition is becoming of the utmost importance. The bulk of the seaside places are as yet summer resorts only, though each year sees a larger number of winter guests, and at some communities, notably Atlantic City, the winter season has become quite an important factor in the municipal economy.

Bar Harbor, a village in the town of Eden, Mt. Desert, Maine, is without doubt, at the present time, the most popular watering place on the whole Atlantic Coast. It faces north and northeast, towards the Sullivan Hills and the upper end of Frenchman's Bay, the mountains of the island coming close to the outskirts of the village on the other two sides.

As there appear to be at least half a dozen other places on the island where the physical conditions would seem superior, and that are geographically more accessible, just why Bar Harbor was the one place on Mt. Desert that attracted people most is a question that has never received a satisfactory answer.

The soil at Bar Harbor is for the most part, a stiff, retentive blue clay, holding considerable water; sufficient in quantity to render even some of the higher portions of the village decidedly wet in mid-summer.

To the westward of the village, 1½ miles distant among the mountains, is Eagle Lake, a beautiful sheet of water finding an outlet through Duck Brook to the salt water at a point perhaps a mile north of the village. Just below the lake Duck Brook is dammed, making a reservoir, from which the public water is drawn. Until 1882 this was carried in a wooden sluice, sometimes covered and at other times open, across pastures and wild land to a second reservoir or tank, constructed of wood, immediately adjoining the village. From this last reservoir the service pipes, of iron, deliver water to customers throughout the the village. This public water up to 1881 was used only during seven months in the year, the old wells, in existence previous to the introduction of public water, being brought into service again during the winter. In 1881 a new reservoir, having capacity of some millions of gallons, was built of earth, on the line of the sluice connecting the two reservoirs, and a 9″ cast iron pipe laid over a new line from this new reservoir to the village. This gave a greater head of water (185 feet) and furnished a much more abundant supply. The old tank was very leaky and the flume lost more water along its line than it delivered at the tank.

The water works are owned by a private corporation which increases the facilities as fast as there is any demand. So popular has it been that at the present time it is rare to find a house in the village with either well or cistern water.

There are three main public sewers in the village and in addition all the laterals necessary to give the best service to the entire community. For some reason, unknown to the writer, all sewers are cement pipes, eight inches in diameter, with man-holes placed from 500 to 600 feet apart; in every way intended to secure the best of sewerage. Five thousand dollars of the public money was spent on this item alone, at Bar Harbor, during 1881.

All main sewers are intended to discharge below low water, and this is necessary, because sewage deposited on the shore from drains discharging at a higher level has already made itself obnoxious at one or two points.

All the principal hotels (there are nearly twenty of them) and most of the cottages are more or less thoroughly plumbed, and their drains connected with the sewers. There are very few privies in use in the village, everybody preferring and using water carriage, while cesspools are equally rare. Curiously enough, there is to be found here, side by side, some of the worst cases of "skin" plumbing and others of the most beautiful construction and ingenious planning. The reason is evident enough. Till comparatively recently Bar Harbor was a fishing village, where the occasional summer tourist was fed mostly on salt fish, doughnuts, and huckleberries. The few cottages that constituted the village depended upon wells and cesspools, or, perhaps, wells without cesspools, for their water and drainage. Suddenly Bar Harbor became a fashionable watering place, the fishermen's cottages gave place to great tinder-box hotels, each accommodating hundreds of people; and the little primitive fishing village of twenty years ago is to-day provided with macadamized roads, water works and sewerage, with street lamps, telegraph, daily papers, and a club. At first the people failed to realize the change and retained the wells and cesspools, till the typhoid outbreak at the old Bay View House, caused by a leaky drain, brought them to a realizing sense of the situation. Aside from the painful result of the cases of typhoid referred to, probably there could have been no more useful lesson given to the citizens, and the present sanitary arrangements are the legitimate results of the changes begun at that time. Even "skin" plumbing has the merit of being a move in the right direction.

As a rule, the private houses are better plumbed than the hotels, and many of the latter will have to be entirely re-plumbed before they can be considered satisfactory, but the gratifying fact is everywhere observable that, without exception, householders express anxiety to perfect their drainage arrangements so that there can be no question in regard to them.

The English plan of having the soil and main wastes pipes outside the walls of the house, is here more generally in use than at other places visited. For a house occupied during a few of the warm months each year only, there seems to be no valid objection to the introduction of this arrangement of plumbing, even in the cold climate of Mt. Desert, and it possesses a very decided advantage, where the work is of doubtful quality, in being largely out of doors; hence, less liable to injuriously effect inmates. Bar Harbor is very like a rapidly growing Western town, and the surroundings of some of the houses are sometimes left in very primitive condition. Instances of this are indicated in the two plates shown, made from photographs, altered slightly to avoid too personal an application.

PLATE I

PLATE 2

Plate No. 1 shows the back of a hotel accommodating 125 people; two lines of soil pipe and a bath-room waste and house leader (all on the outside of the house), which deliver into a vitrified pipe, laid on the surface of the ground. This pipe runs parallel with and close to the side wall of the building, and in the foreground of the picture is just under the plank at the right. The kitchen, at the left, connects with vitrified drain by a lead pipe near the kitchen steps. This pipe is perhaps two or three inches under ground. It is not unusual for market wagons to drive between the two buildings, and the vitrified pipe has been more than once broken at the joints by contact with the wheels of a vehicle.

Plate No. 2 represents the same general arrangement, except that the drain pipe is supported on a plank, and the ground water (within 18 inches of surface) has not been

* Report of E. W. Bowditch, C. E., to the National Board of Health.

Digitized by Google

drained off. The main drain consists not of vitrified pipe alone, but of vitrified, cement and iron pipes, patched together in an inexcusable way. This pipe has also been broken a number of times by teams striking it. The proprietor of the house stated (it has since been corroborated by fact) that he considered his outside arrangements of only a temporary character, and that they were put up in a great hurry in order to be able to open the house for the season.

A local board of health of three members was organized in 1880, and although an excellent beginning has been made, a few further changes might be instituted to good advantages. Garbage is regularly removed by scow and dumped in deep water in Frenchman's Bay, and people are forbidden to throw it in the streets as was formerly done. The collection might be better made in water tight carts, but at present every one attends to his own carting. All nuisances are abated, etc., etc.

A rather unusual nuisance which has recently been abated at Bar Harbor, is a settlement of Quoddy Indians, comprising some seventy-five families, who camp during the summer months as near the village as possible, selling baskets, etc., etc., to visitors. In the past they have been a positive source of danger, owing to their filthy habits, but after an experience of several fatal cases of diphtheria, and a consequent scare among the summer guests, the Indian colony was put under the charge of the Board of Health —with excellent results.

The resident population of Bar Harbor is not over 1,250 souls, and the hotel accommodations are not for so large a number as is generally supposed. In the middle of the season there may be 5,000 guests—not more, though it is the custom to entertain four or five different sets of visitors during the season.

It would be a large estimate, however, to claim that there were 20,000 guests at Bar Harbor during any season. Undoubtedly the shortness of the visits made is an element to be considered in the freedom of the visitants from preventable disease, although a consideration of this kind should not abate one jot all sanitary precaution possible, since it is well, even from the narrowest possible commercial view, to establish the health of this favorite resort as best beyond all question.

Summer resorts, when first started, naturally depend upon either well or cistern water for drinking and cooking supplies. As a settlement grows, the well water, unless artesian, deteriorates in quality. As soon as this pollution begins, other water should be used, and as it is frequently impossible to obtain a public supply, cistern water of necessity is made use of.

Rain water, at least, must be pure, is the saying, and so it is, if properly collected and stored. As many people use cistern water to the exclusion of all other, a list of memoranda taken from the field notes of a single season's work may prove of service to readers.

Cisterns have been examined, mostly for cause, and many found to contain impure water. The different causes for the contamination, arranged according to the frequency of their occurrence, are as follows:

First.—Rotten shingles, leaves, hair, roots of trees, string, paint, putty, paper, etc.

Second.—Thin, improperly built brick walls, badly constructed inflows, and leakage from drains and cesspools (many brick cisterns, arched, and covered with loam and sod, show arches and walls above inlets not perfectly tight, manure used as top dressing on the grass overhead not infrequently soaks through).

Third.—Excrement of birds on the roof from which the water is drawn.

Fourth.—Chamber slops thrown on the roof, and thence passing direct to the cistern.

Fifth.—Overflow emptying into cesspool or drain, and receiving gas or liquid from the same on account of partial or total stoppage of drain, or filling of cesspool.

Sixth.—Walls, partially constructed of brick formerly used in old privy vaults.

With the exception of No. 3, the causes of pollution enumerated are all preventable, and within the grasp of the proprietor. Not so, however, frequently with wells and sometimes with public water supplies, and where any doubt exists as to the quality of the drinking water it may be stated in general terms, that rain water collected from a clean roof, slated preferred, passing through metal gutters and leaders, into a carefully built, cement lined, cistern (having overflow connecting with no other drain) and then through a two-inch brick filter, should give a very fair quality of water, fouled perhaps to a slight degree by the chimney flues and birds, and possibly a trifle hard, but usually not enough to constitute a valid objection to its use. This, of course, applies to country houses only.

In construction, the acknowledged fact of the porosity of all brick and cement work, no matter how carefully put together, is frequently lost sight of, hence many of the cisterns when empty, or partially so, have a tendency to attract water from the outside.

It is obvious that years of steady intelligent work must elapse before summer hotels are sanitarily what they ought to be, and probably still longer before private houses can be considered wholly satisfactory, but if the resorts visited represent a fair average, there is good ground for hoping that the efforts of local boards of health will speedily produce good results of a tangible nature.

It is worthy of mention that with the single exception of Newport, where the existing condition of things may be considered abnormal, local boards of health have proved of decided advantage, always to the comfort, and frequently to the pecuniary well being of the communities they serve.

SUGGESTIONS ON RAISING THE PERSONEL OF PLUMBERS.

To the Editor of THE SANITARY ENGINEER:

I think it will be allowed by those having a thorough knowledge of the facts, that the plumber occupies at the present day, at least in this country, a somewhat equivocal position. He is classed by the general public as a tradesman or mechanic, and, at the same time, a scientific knowledge and practical skill is expected of him that would not disgrace many of those holding scientific and professional rank. While, of course, he must be skilled in the hard part of his business, and have a practical knowledge and practice in the manipulation of the many substances that he is compelled to use, yet, in order to apply these substances, so that certain results may follow, he must, of necessity, be well informed in the science of his business. This scientific knowledge is not to be acquired in the ordinary way in which trades are acquired, and so far no means, or, at least, very limited means of acquiring this knowledge is within reach of the ordinary plumber. An attempt is being made to supply this deficiency by the employment of men who have had more or less scientific training, and who call themselves sanitary engineers. While these gentlemen have no doubt done a vast deal of good, both practically, and by calling the attention of the public to the necessity of such knowledge as they possess being employed, still, in my opinion, the actual want will not be filled until we have a class of plumbers who, while having a practical knowledge of what may be called the strict trade part of the business, shall, at the same time, possess the scientific training necessary, and any permanent improvement must have this end in view. The plumbers of to-day occupy a somewhat similar position to what doctors did some centuries ago, when the barber and surgeon, the herbalist, and quacks of all sorts practiced the healing art—and the practice was certainly not in the direction of the greatest good to the greatest number. What would be thought of a surgical operation presided over by a scientific gentleman who was thoroughly informed in the laws relating to the body, and the mechanical part of the operation done by a butcher under his direction? The amount of success would not be great, but given the trained surgeon skilled in both the science and practice of his profession, and the results are all that can be desired. The work of the plumber carried on as at present is very much in the same predicament as the foregoing. It is no use saying that a scientific knowledge is not necessary, as, given some one to instruct in what is to be done, the mere doing of it is only the mechanical operation requiring but limited skill and care. In order to succeed, a thorough knowledge of the results desired to be attained, and the science combined with practice necessary to produce these results, is absolutely necessary.

As the people early saw the necessity for protecting themselves from quackery, and enacted laws by which there was some certainty of the healing art being in the hands of men having at least the mental ability and some special training in the practice of their profession, and as, in the present day, the people are beginning to see that the plumber's art is one requiring some special training and skill, in order to ensure success and not render futile the efforts of the skilled physician, they must enact laws to this end and provide means whereby the wants will be supplied. When we consider the almost unanimous verdict of skilled physicians and sanitarians on the subject, it is a matter of surprise that something more has not been done in this direction ere this. Will not some of our colleges or schools of technology take this matter up and institute a special course of training for such as desire it, and confer a degree—or some mark to one who has passed such an examination, as may be deemed necessary—as will be a guarantee to the public that the holder of the same has the ability and skill necessary to qualify him in time to obtain a thorough knowledge of the art he professes? A change in this direction would, of course, be gradual, and should be so carried out as not to be injurious to those who are at present carrying on the business in the old plan. Our boards of health might be given the power, and be so constituted that a certificate of qualification from them would be of advantage to both the possessor and the public. I should say that if the latter course was adopted, that there should be three grades or classes, the third or lowest given to such men who could pass a verbal examination in the mere handicraft of their business; the second such as, combined with the former, could pass a similar examination, giving the reasons for their practice; and the first, or highest, to such men as could pass an examination giving answers in writing to such questions as might be considered necessary, and also draw an intelligable plan and write a specification suitable for the work of any first class building. The latter, or first class men, should also be required to pass a matriculation examination, showing that they were possessed of an ordinary education; provisions would, of course, be made to allow men having third or second class certificates to qualify at any time for their post. It is not mere hand-skill that is required; honesty. address, appearance, a knowledge of human nature, are also required in the man who is to win the confidence of the public, and a higher standard of recruits, to use a military expression, is absolutely necessary.

If, Mr. Editor, you think my views worthy of publication, I may at a future time recur to the subject, going more fully into my reasons and views, and giving my ideas of the qualifications required in a first class plumber.

J. W. HUGHES, *Practical Plumber, sometimes Practical Sanitarian.*

64 CRESCENT ST, MONTREAL.

IS THE MAIN DRAIN TRAP LIABLE TO SYPHONAGE?

NEW YORK, *Feb.* 17, 1883.

To the Editor of THE SANITARY ENGINEER:

I see by the *Boston Medical and Surgical Journal* of the 15th inst. that Mr. Ernest W. Bowditch, in a paper on trap syphonage, read before the Suffolk Medical Society, has stated that—

"The cause of the unsafe condition of the sewer is the fact that the sole obstacle to the entrance of gas into the house fixtures usually consists of a so-called 'running trap,' which is supposed to effectually seal the pipe between the house and the main sewer or cesspool. The fact, however, is that the flow of water through the drain, particularly if a considerable quantity be discharged suddenly, tends to empty the trap by means of the suction produced by its passage through the farther portions of the drain, and thus an unobstructed channel is at once opened between the sewers and the dwellings connected with them."

This is a most important matter, for as at present plumbed it is safe to say not one house in a thousand has a vent against syphonage on its main drain trap, for it has been taken for granted that the size of this trap (four inches and upwards), together with the fact that the house drain outside the trap is practically horizontal and not often less than six inches in diameter, and therefore difficult to fill, rendered the risk of syphonage so small that it could be disregarded. If Mr. Bowditch's statement is true then the vast majority of the best plumbed houses in this and all other cities are as unprotected against the sewer, as a bath or basin is with its trap not vented. It seems to be a point on which you might state your opinion. W.

[Our opinion is that the statement quoted by you and the inference you draw therefrom, takes an extreme view of the case. The flow through the main trap is not often so rapid as to produce the syphonage referred to, and when it does occur not many minutes usually elapse before sufficient water drains into the trap to restore the seal. We do not consider this possible contingency any cause for alarm, though we do not like what is called a running trap in such a situation, but prefer the form in which the flow line of the house drain is above the seal of the trap. See page 61–81 of Vol. V. of this journal.]

Correspondence.

WARMING CHURCHES.

NEW YORK, *Jan*, 25, 1883.

To the Editor of THE SANITARY ENGINEER:

In the matter of supplying *direct radiation* to churches, I would inquire what you think of placing a coil in each pew? Of course I do not lose sight of the necessity of the ventilating shaft, or some other method of moving air, with a good proportion of indirect radiation for warming the supply of fresh air, but it does seem to me that a coil might be placed near the floor, and directly in the rear of each seat, so as to be at the feet of the people in the next seat behind, or under the seats, provided they are so constructed that the heat will not pass up in front of the seat under which the coil is, but to the pew *behind* the coil. Fearing I cannot make myself well enough understood, I send you the enclosed sketch.

These little coils, *a*, will connect with the steam and return main below the floor in nearly the usual way of large coils, without valves; but to avoid long return connections, I think the main return pipe can be as well carried along side of the main steam, as shown, than on the floor, as the basement is generally fitted for a class-room or chapel.

What do you think of the plan generally, and will

not the warming of the room from below rather than from above be advantageous in this case, as it will allow each person to have a "foot warmer," so to say; and cannot a church be made more comfortable, even with a lower temperature, than by most other methods?

A shows one way, with a hanging partition, so the heat cannot pass front. *B* shows it with the coil in the pew, and for those who kneel, the stool can be made to cover it, if required. Very respectfully yours, ENG.

We believe the First Baptist Church of Detroit is done somewhat in this way; at least, every pew has its coil. The plan is not new though uncommon, and suggests several interesting questions, on which we would like the views of our readers.

The problem of church warming is very unsettled. Churches can be made warm even to be disagreeable at parts, and be uncomfortably cold at the same time in other positions, and this happens with nearly all our present methods, as no one rule can be made to suit all local conditions and styles of architecture. If pews run to the floor, the *counter current*, which must always set in, sweeping to an outlet or a radiator with indirect radiation in the one case, and direct radiators set at isolated positions along the walls, in the other, will be interrupted, and will have to pass through the aisles, or on a line near the top of the pews—which should be the *neutral line*. On the other hand, when the pews *do not* run to the floor the return current is at the floor, and *over one's feet*. A person sitting in a pew which runs to the floor, and is furnished with a door, with no heating source within it, with the pew in front of a window, will always be cold (in cold weather). The cold air will fall from the glass and settle in the pew, and will have to overflow to get out, leaving the pew always full of the air of the temperature at which it falls into the pew, and not of the temperature of the body of the church, the occupant being immersed to the middle in air much colder than the rest of the house. The same thing is experienced, though in a less degree, with the pews which abut on the piers between the windows.]

LINING TANKS WITH TINNED COPPER.

LITTLE ROCK, ARK., *Jan.* 15, 1883.

TO THE EDITOR OF *The Sanitary Engineer:*

I would like to see some directions in your columns about lining tanks with tinned copper, and the methods of soldering. A. M.

[The size of the tank and sheets of copper at hand determines the method of lining.

Sheets of tinned copper usually kept in stock are 16" x 34", 24" x 48", 36" x 72", 48" x 72", etc.

A tank such as is usually used to supply a water closet, should be made to suit the copper in order to prevent waste.

One sheet 16" x 34" and one 24" x 48", will line a tank 23" long; 16" deep and 15" wide.

Take the small sheet and cut it in two, making two sheets 16" x 17" for the ends; turn up two long sides and one short end ½ inch; set and tack them in place; turn down the top edge and tack it. When the two ends are in place mark off the large sheet for the sides and bottom. Then turn clear back half an inch of the two long edges which make the end corners; then turn up the two sides and set and dress in place.

Use the ordinary tinners' solder and copper iron, with fine powdered, clean rosin.

It is well to have all tanks made to suit the copper; when this cannot be done and the tank is a large one (required to be lined in place,) procure the most desirable sheets (if you are not able to get them rolled to suit), lock-seam the bottom and put it in place and solder it; then get out the sides and ends to make one entire piece, if practicable; seam and solder them together on the floor; roll up and unroll in place. It is desirable to have only one upright seam to wipe.

If the copper will admit of it, it is much better to turn up the sides and ends, say about four or five inches, to let them project on the bottom, turning under the edge as described for the small tank. In this way it is much easier to solder, than it would be in the corner. If this can be done, the bottom can be put in to suit the sides and ends]

SIZE OF HOUSE DRAIN.

CHARLESTON, W. VA., *Jan.* 31, 1883.

To the Editor of THE SANITARY ENGINEER:

I have a few questions to ask you in regard to draining a block of buildings which I show on plan on the other side. There is no sewer in the street. I want to put in an 18-in. tile sewer at the back of the buildings, ¼-in. fall to the foot, to drain the cellars and take the water from the roof, also several water closets. I give you the size of block, which is about 280 x 100 feet, the area point just inside wall. I would like to put in some kind of a back water trap to keep from flooding the cellars in case of high water in river. Any information you can give me I will be glad to get, as I take THE SANITARY ENGINEER for authority on all of my work. Do you think the sewer is large enough to do the work it has to do? Hoping to get as early an answer as possible, I remain

Yours respectfully, FRANK FERGUSON.

[Assuming a fall of ¼-in. per foot, an 8-in. pipe running full would carry all the roof water from a heavy rain storm besides the sewage of the block given. Consequently 18-in. would be too large, and we think a 10-in. pipe sufficient; a 12-in. would be ample beyond any question.

Dealers in plumbers' supplies sell a sewer valve which is fitted to the end of the house drain, and usually hangs open, but when the tide or any back water rises, closes to prevent its admission into the drain.]

BLEEDING GRAVITY APPARATUS.

SPRINGFIELD, *Jan.* 23, 1883.

To the Editor of THE SANITARY ENGINEER:

I work for a steam fitting house that does considerable work on the gravity or return principle. It frequently happens that we have to warm a basement room, or sometimes a whole basement, especially in business buildings. The practice has been to put radiators on the floor of the basement (which is below the water line), and carry a separate return back to a tank in the boiler room, when there is one, or to the sewer when there is no place else to run it. Is this right, and if it is not right will you suggest a better way, and oblige a reader?

Yours respectfully,

KING.

[You do not say whether your employer uses a trap on the end of the return pipe for the basement, but we presume he does. Your practice is not good, and we are sorry to say there are men in the business who do just this very thing, and control, or attempt to control, the waste of water or steam by a simple valve only. The water from these radiators, or from any radiator or heater below the water line, can be collected in a small receiver, of from five to ten galls. capacity, through the separate return pipe, and automatically pumped into the boiler by a Pratt & Whitney, or an Albany trap.

When water is drawn away from a system through pipes (or traps) as you mention, the amount drawn is an unknown quantity, and with imperfect traps may be very large; but aside from the loss of heat, there are two other things to be considered, namely, the chance of getting low water in the boiler, in a very much shorter time, and the injury done to the boiler if you have to feed bad water; putting it on the same footing as a boiler which has to supply steam for an engine.

Sometimes the hot return water from a rising line is passed through a coil in a basement, to warm one room, and we think the condensed water from five or six radiators on a line above, should warm one basement room, of about the same capacity as one of the six rooms above it, assuming all to be about the same size.]

COVERING FOR WATER PIPES.

To the Editor of THE SANITARY ENGINEER:

What do you consider the best material for keeping lead pipes from freezing? How is mineral wool?

Yours, W. LANIER,
NEWARK, N. J. *Plumber.*

[In our issue of April 27, 1882, page 454, we suggested mineral wool as a good covering for the purpose indicated. We know of nothing better.]

SUPPLY TO WATER CLOSETS.

To the Editor of THE SANITARY ENGINEER:

Will you please give me your opinion of this plan for an air chamber on supply to water closets, and oblige, B.

[This will propably relieve the water hammer until the water has absorbed the air in the air chamber. If it is necessary to rely on air chambers in such a situation, some means should be provided for replenishing the air. It will be understood that we do not endorse such a direct supply to a water closet as this sketch implies.]

MONTREAL, *February* 12, 1883

To the Editor of THE SANITARY ENGINEER:

I have read with profit and interest the many articles you have published on boiler circulations, the last being the communication of "Chas. S. Hasting" (Feb. 8). The circulation below the boiler as there mentioned acts in accordance with known laws controlling the circulation of water in pipes. In this connection I think if you would publish extracts from a "Practical Treatise on Warming Buildings," etc., by Chas. Hood, fifth edition E. & F. N. Spon, Chapt. 11, with cuts, and such explanations as would make the practical application of the rules to the plumbing department clear, it would do much to make the question fully understood. Your correspondent's idea of heating his conservatory by hot water from coil in connection with a Boynton furnace is an old one here. We have a system of heating in common use which we call "combination," being a combination for hot air for heating the ground flats and a system of pipes heated by a coil in a furnace, or a cast or wrought iron heater in connection with same for warming upper floors, small conservatory or rooms at a distance not easily reached by hot air. There are hundreds of such apparatus in use in this city where I believe it was first introduced, the writer being one of the first who worked to bring the plan to a practical use.

J. W. HUGHES.

THE NATIONAL BOARD OF HEALTH AND CONGRESS.

During the discussion of the Sundry Civil Appropriations Bill in the House of Representatives, the 20th ult., on an amendment by Mr. Manning that the $100,000 to be expended in case of epidemic, should be expended under supervision of the National Board of Health, his remarks being:

MR. MANNING. It is not my purpose to speak at any length in support of this amendment, because it has been discussed on several occasions and in several Congresses so thoroughly that every gentleman must recognize the importance of this Board and its qualifications to discharge the duties imposed upon it by law, and the incalculably valuable service it has rendered.

There is one place in the country particularly that is unfriendly to the National Board of Health. Some acrimonious feeling exists in that place toward certain members of the National Board of Health. But I have never seen nor do I expect to see any well-grounded charge against the integrity or the capacity of either the president or any prominent member of that Board. Being competent, having had experience, it is important in my judgment that they shall supervise the expenditure of this appropriation.

Mr. Ellis, of Louisiana, hostile to the Board, said:

MR. ELLIS. I regret very much that this debate has arisen, for I shall be forced to say some things that I had rather would remain unsaid.

In my judgment the National Board of Health is the most stupendous national humbug that was ever incorporated or was ever sustained by any government. If there is any one place in this country that ought to grasp at any means or agency for protecting and preserving the public health, it is the city which I represent here. Nearly always the first attacked, always the one to bear the brunt of these epidemics, it is particularly the place above all others that should most desire that proper means be adopted for maintaining the public health. For these epidemics have made her history pathetic with sorrow, have paralyzed her commerce, have thrown over her semi-tropic beauty the odor of the pest-house, and have retarded her swift march to the acme of commercial and social supremacy. And in the light of reflections like these, and stimulated by the terrible memories of 1878, I voted for the law creating the National Board of Health. Yet, I regret to say, that from documents in my possession, taken from their own books, it is demonstrated that they are not only incapable of dealing with the problem submitted to them, but they have fritterd away the public moneys appropriated for them, in some instances, it seems to me, uselessly and foolishly, not to say extravagantly. It is a source of regret to me that I am obliged to give to the public records facts such as are before me.

For instance, they were appointed and constituted a board for the purpose of preventing the introduction and spread of epidemic diseases in this country. I have here a record taken from their own books showing how they have expended some of the public money placed at their disposal.

They have been paying a lot of doctors out of the public moneys, for the purpose of compensating them for writing essays. Here is a record of two essays, one written by Dr. T. S. Verdi, of this city, a member of the National Board of Health; another written by Dr. James Law, Professor of Cornell University. Those two gentlemen were paid $300 each for two essays. On what subject? On any epidemic disease? On the small-pox, on the yellow fever, or any disease that threatens the public weal? No, sir! Essays on diseases of animals. What have they to do with the diseases of any animal, except of the animal—man?

Here is another doctor who was paid $500 for an essay upon diphtheria, a disease which occasionally prevails all over this country everywhere, and can in no sense be denominated a foreign disease and brought into this country.

Another, Dr. Kedzie, is paid $300 for an article on food and drug adulteration. Another is paid $6,000 for an essay on the pollution of the soil, and another is paid $4,000 for an essay on pollution of water. And here is another, who perhaps jaunted in the hot months over the land, who was paid $1,000 for an essay upon the summer resorts of this country. Sir, let me read these items in detail, for the country should know what goes with the public moneys. * * * * *

This bill, with its items, shows that these gentlemen have been paid somewhere in the neighborhood of $30,000 of the public money for sitting down in their offices and writing essays on various subjects.

But more: In regard to yellow fever, they have formulated the idea that all the inspection and quarantine and disinfection of all the commerce of the Gulf should be concentrated and performed at Ship Island, in the Mississippi Sound. What have they done at Ship Island? They have erected two very ordinary board buildings, which at the outside, as I am informed, could not have cost more than $6,000 or $8,000 all told. By their own report, they have inspected in the last two years nine vessels, and they present to the Government a bill of $65,000.

Mark it, sir; they have expended $65,000 at Ship Island, and yet in the year they have inspected but nine vessels, which foots up the nice little item of about $7,000 for the inspection of each vessel.

I hold in my hand the report of the National Board of Health for the past year. Let me read a few lines to see what they have been doing. I read from page 4:

Among other results fairly deducible from these various experiments the following may be cited:

1. Clear proof that loss of organic matter does occur during the evaporation of water prior to combustion of the residue by Frankland's method, contrary to what has always been claimed by Frankland.

2. Evidence of a source of serious error in the determination of nitrogen by the same process, there being a notable gain of nitrogen from the atmosphere.

3. Much fuller information than has hitherto been obtained as to the extent to which definite substances belonging to various chemical classes, and including some of the known products of putrefaction, are attacked by potassium permangranate in acid and in alkaline solution.

4. An extended comparison of the practical results of the Frankland, Tidy, and Wanklyn processes, as applied to a series of waters from known sources and of known sanitary (or insanitary) character, also to waters artificially polluted with sundry forms of manufacturing refuse, and with forms of organic matter liable to be encountered in connection with ordinary water supply.

5. Proof of the error of the statement by Wanklyn that urea is not decomposed by treatment with alkaline permanganate in such a way as to yield so-called "albuminoid ammonia."

6. Results of the exhaustion or continued treatment of organic matter by the Wanklyn and Tidy methods.

7. Results of biographical experiments (subcutaneous injection of rabbits) with waters examined simultaneously by chemical processes.

"Now listen, all ye gods!" In the heavy slumbrous air of the tropics the Angel of Pestilence is hovering with lungs breathing poison and outstretched wings from which death drops, preparing to swoop with the death instinct of the vulture and the fierceness of the condor upon the Southern coast. Cities grow pale and the land cowers with dread, and men cry for help from the threatened death. Where, then, is the National Board of Health? Gathered about a table, that distinguished body is engaged in inspecting a certain kind of water under the skin of a rabbit, just to see how the rabbit will like it, and how the health of the rabbit will be effected by it. [Great laughter and applause.] Was there ever such a spectacle! But again, sir, I charge that there was a deliberate attempt on the part of certain members of the National Board of Health to create the belief that yellow fever prevailed at New Orleans at a time when that city was in perfect health.

* * * * * *

Again, sir, I charge upon this National Board of Health the inauguration of an inspection system as odious as it was useless. New Orleans was free from fever; as healthy as any European or American city. There was not a single case of yellow fever; and yet an officer was established at the railroad depots, and if a citizen wished to go into Mississippi he was obliged to pay this officer an inspection fee for a health certificate. He did not feel a pulse, examine a tongue, inquire where you had been—all he wanted was your name and your fee and the certificate was furnished authorizing you to travel into the State of Mississippi. Was ever such nonsense and folly?

[Here the hammer fell.]

MR. DUNN. I move to strike out the last word. Now, Mr. Chairman, I am not a special champion of the National Board of Health; I am not personally acquainted with any member of that board, but I do know some things which perhaps the House had better know before it acts on this matter. The gentleman from Louisiana (Mr. Ellis) has only given voice to the hostile sentiments of the Louisiana State Board of Health.

MR. ELLIS. I beg the gentleman's pardon.

MR. DUNN. Or the New Orleans Board of Health, or both.

MR. ELLIS. I give my voice——

MR. DUNN. I do not yield to the gentleman from Louisiana. He has given some few instances to which he points as suspicious, in which the National Board of Health since 1878 and 1879 has failed to disinfect vessels.

He says if any place on the face of the earth should be profoundly interested in measures to prevent the introduction of that terrible pestilence, yellow fever, New Orleans is that place. Now, has New Orleans been watchful in that respect? That they would be interested in measures to keep it out of New Orleans is unquestioned and undoubted.

But after that terrible pestilence has gotten into that city, where it always finds a ready *nidus*, their State and city boards of health have not been prompt to sound the alarm and give warning to neighboring States and cities. In the past we have been always long kept "upon the ragged edge of apprehension" by rumors of the prevalence of pestilence and official denials until that dread pestilence finally becomes epidemic and can no longer be concealed.

The neighboring States around Louisiana—States having commerce with that city—have learned that the Louisiana State Board of Health serves the commerce of New Orleans, and, as all now believe, conceals the existence of pestilence in that city. In 1878 did your State Board of Health alarm the country and tell us yellow fever was there in May and June?

MR. ELLIS. Yes, sir.

MR. DUNN. No, sir; it was denied until it had spread abroad. It was declared epidemic in Memphis before it was in New Orleans, and yet it was carried from New Orleans to Memphis.

Did you prevent it from going out on the railroads and steamboats like infernal machines spreading pestilence upon every avenue of communication?

MR. ELLIS. We gave warning.

MR. DUNN. Until the whole country fell a victim to that terrible pestilence and was devoured as with a consuming fire?

The people believe that your State Board of Health, serving the commerce of New Orleans, is willing to peddle death to this country in order to keep up its commerce, and it has done it. And those surrounding States will not trust it because they have learned from terrible experience that they cannot do so.

They believe in the conservatism of the National Board of Health, which cannot be brought under the influence of the commerce of New Orleans or of any other city. They believe in a power lodged somewhere by this Government that rises above those influences and can give the pledge of this nation for some measure of protection.

Last year we were assured that it should be given to the Marine Hospital Service. It has not been done. They made an appropriation and placed it at the disposition of the President. I do not know what agencies the President will employ. I do not know what measures he may take. If there are any within his reach it is very well. I do not care whether you preserve your National Board of Health or your Marine Hospital Service, but in God's name give the country some measure of protection, some authority clothed with ample power to give it assurance of protection. Do not leave the country at the mercy of merchants and traders who will peddle death and pestilence for gain. What we want, what the interest of humanity demands is some guarantee against the introduction and spread of pestilence. We have commercial relations with the tropical countries where yellow fever always prevails, and hence we are annually threatened. We should have some permanent organization with power and means to keep out pestilence. The President is not at all likely to act until it reaches our country and finds lodgement somewhere.

[Here the hammer fell.]

MR. MANNING. Mr. Chairman, I have no feeling in regard to the matter. I hardly think the gentleman from Louisiana (Mr. Ellis) can claim as much. I will remark in the outset that perhaps it would be very well if there was a critical inquiry into the conduct of the State Board of Health in his State. But I will not follow that up, as it has been referred to by the gentleman from Arkansas (Mr. Dunn).

I do not care to comment on the frightful facts in the history of the yellow fever epidemic of 1878, when 100,000 people were stricken, 20,000 hurried into their graves, and more than $2,000,000 of property sacrificed each day for the whole period of the epidemic; and much of it, it is claimed, the result of the negligence of the people of New Orleans and their desire to preserve uninterrupted their business interests

Now, I want to say to the gentleman from Louisiana that I never heard before of these imputations that he has cast against Dr. Cabell and the worthy gentlemen who surrounded him upon the Board. And I must look further before I accept the statement made, which has been put into his hands doubtless by those gentlemen of New Orleans who sent forward the other day an ill-tempered pamphlet in order to prejudice Congress when it reached this clause in the bill. I remember what the gentleman from Virginia (Mr. Tucker) said of Dr. Cabell last session, and I do not believe it possible a man of such purity and intelligence would be capable even of conniving at any such shameless conduct as that which has been imputed; and until we learn more of the merits of the accusation preferred by the gentlemen from Louisiana it is just to interpose his hitherto unquestioned integrity and demand additional evidence. Good character is worth but little if it can be struck down in this manner.

But let me say, Mr. Chairman, in the gentleman's own city I might name, if it were profitable to do so, several prominent physicians who do not sympathize with the view that he expresses at all, nor the criticisms that he has made on this floor. On the contrary, if they were here to-day they would uphold our hands and plead not for passions or prejudices, but for human life against treasure. You should not put treasure in the scale upon the one hand and human life upon the other.

Mr. Manning in reply to Mr. Ellis, spoke as follows, in part:

MR. MANNING. The gentleman from Louisiana (Mr. Ellis) complains that good faith has not been shown by the National Board of Health in the discharge of its duties, with regard to epidemic diseases, the preservation of the public health, and the expenditure of public funds. He complains also that criticisms have been visited upon New Orleans by the gentleman from Arkansas (Mr. Dunn), who spoke in support of my amendment, and myself.

Now, gentlemen who live in glass houses should not be the first to throw stones. It was in reply to an imputation of the grossest bad faith that I responded this afternoon just before the House took a recess. I have no feeling about the matter more than would be aroused in any one who has an interest in human life above treasure.

I cannot be charged with going too far when I say to the gentleman from Louisiana (Mr. Ellis) that I prefer to accept the judgement pronounced in good faith and upon satisfactory evidence by the physicians of State Board of Mississippi with reference to the conduct of the State Board of Louisiana and the conduct of the people of New Orleans touching the matter in question.

I have no doubt that the people of New Orleans will compare well with the people of other portions of the country. I would not detract one particle from their

Digitized by Google

reputation as worthy people, but they are human. Who doubts that local boards must be swayed more or less by local influences? And does not our experience demonstrate that local boards are deemed unsafe?

The State Board of Health of Louisiana gave out only a few years ago to the people of the country a statement in which they set forth that the commercial losses alone to New Orleans by interruption of intercourse with the surrounding country and the diversion of trade to other cities footed up in the aggregate $5,000,000 during a yellow fever epidemic of about four months, a million and a quarter each month; and the actual cost of the epidemic to the material resources of New Orleans exceeded $10,000,000. They were out of humor with their neighbors for establishing such a strict quarantine as to shut up the gates of New Orleans and cut off commercial intercourse with that city.

The State Board of Health of Mississsppi sent this telegram last year, when a similar bill was under consideration, to this House. I read it as contributing to the force of my statement that the National Board of Health is worthy of credit. It was addressed to the Mississippi delegation, and reads as follows:

JACKSON, MISS., *July* 24, 1882.

Senators LAMAR and GEORGE, and Representatives MULDROW, MANNING, MONEY, SINGLETON, HOOKER and LYNCH, (care J. Z. GEORGE, Washington, D. C.):

The State Board of Health, at a special session held here this day, have unanimously agreed that the National Board of Health can and will perform vital and important sanitary services that can be rendered by no other body, and would respectfully urge you, in view of the important interest involved, to do all in your power to obtain such an appropriation from Congress as may enable that Board to fully discharge its responsible duties in accordance with the plans foreshadowed in its annual report.

F. W. DANCY, *President.*
C. A. RICE.
W. F. HYER.
J. N. BENNETT.
W. D. HILL.
B. F. KETTRELL.
J. W. BLANKS.
E. P. SALE.
WIRT JOHNSON, *Secretary.*

Last year the State Board of Health of Mississippi sent a telegram to the secretary of the National Board of Health calling importunately upon that Board to establish a system of inspection of passengers and freight from New Orleans, stating distinctly that the people of the State of Mississippi could be best protected by the interposing hand of the National Board of Health, and that it was unwilling to rely on the State Board of Louisiana. * * *

I proceed to notice briefly, with such information as I have at present, the charges of maladministration against the National Board of Health, and I do so purely in the interest of justice. not being acquainted with a single member of that Board.

The first charge, as I understood it, was that $65,000 had been spent for inspecting nine vessels on the Gulf coast.

It has been stated to me that the facts are that the station at Ship Island consists of eleven buildings all for storage of cargoes, for disinfection, for sick and well, and quarters for officers and men. In addition, a wharf was constructed, a steam-tug purchased for boarding purposes, and a sloop for the use of the station, and the whole cost of construction and maintenance from its establishment to the present was $65,000—$30,000 for construction, and the rest for maintenance and caring for the passengers and crews of vessels sent there. Twenty-seven vessels were cared for during the past year, and not nine as stated.

This, it will be seen, is a wholly different account of the expenditure of the money referred to. Can the gentleman maintain his assertion?

The next charge is that $6,000 was paid for essays on pollution of soils.

The simple statement of the case as reported to me will fully vindicate the Board from either a corrupt use of public funds or desire to usurp authority.

An investigation by Prof. Raphael Pumpelly, of the United States Geological Survey, aided by Prof. Geo. A. Smyth, upon the influence of various soils upon sanitation, was ordered by the Board, pursuant to the authority conferred by the following section of the original act of 1879, establishing a national board of health.

SEC. 2. The duties of the National Board of Health shall be to obtain information upon all matters affecting the public health, to advise the several departments of the Government, the executives of the several States, and the Commissioners of the District of Columbia, on all questions submittted by them, or whenever in the opinion of the Board such advice may tend to the preservation and improvement of the public health.

This investigation was in progress for more than two years. Prof. Pumpelly was not paid at all for his services. His assistant was paid about $200 per month. The rest of the money was expended in experimental work, being cost of chemicals, instruments, rent of laboratory, etc., necessary for carrying on the work.

Of this work Dr. Frankland, the eminent professor of the National School of Science, South Kensington Museum, London, says of this paper, in a letter to the author:

I consider it to be one of the most important contributions ever made to our knowledge of the propagation of epidemic diseases.

So with all the operations and expenditures of the Board. They will bear the closest scrutiny. They are all made under the supervision of the Secretary of the Treasury.

Mr. King, of Louisiana, also replied:

I am very sorry, indeed, to have to oppose my colleague (Mr. Ellis), and to endeavor to controvert his statements before this House. He has certainly made most serious charges against the National Board of Health, an institution presided over by a gentleman against whom no one can say anything, and who has associated with him men of the very highest character. I presume that his associates are men fully his peers and his equals in integrity and in earnestness to discharge the duties imposed upon that Board.

My colleague has gone into what he calls a statement of facts relating to the expenditure of money of that Board. I would be glad if he would answer me one question, and state from whom he derived the information upon which he has made his statement here.

MR. ELLIS. From the books of the National Board of Health.

MR. KING. Did he get that statement officially?

Mr. ELLIS. They came from a member who took them from the books of the National Board of Health.

Mr. KING. Was he in charge of those books?

Mr. ELLIS. I give them upon the authority of Surgeon-General Hammond.

Mr. King here made a detailed explanation of the cost of the various investigations, a record that we much regret want of time and space forbids our publishing. In concluding, he said:

This is not a trivial matter. It is one that concerns the very life of the people south of the Potomac.

THE BROWNSVILLE QUARANTINE.

On the 11th of October last the Mayor of Pensacola, Fla. (Hon. J. M. Tarble), addressed a letter to the Mayor of Brownsville, Texas, requesting information with regard to the operations of the Marine Hospital Service in and around that city during the recent epidemic of yellow fever. The following is the correspondence:

MAYOR'S OFFICE, PENSACOLA, FLA., *Oct.* 11, 1882.

HON. MAYOR, BROWNSVILLE, TEXAS.

Sir:—For the information of the public of this city will you kindly give us the benefit of the experience of your city with yellow fever and the results obtained by the cordon:

1. Was any tender of assistance to your city made by the Marine Hospital Service other than by the establishment of a cordon?

2. How long was it after the declaration of the epidemic before the cordon was completed?

3. Did the officials of the M. H. S. work in any way antagonistic to or in opposition to the local health authorities?

4. Was pecuniary aid given in any way by the government save in connection with the cordon?

5. What was the nature of the aid given to refugees within the cordon lines? State please, if provisions, medicines and attention were given them.

6. Please state as near as possible the number of people who were removed from the city through the efforts of the authorities, also what disposition was made of them.

7. After the expiration of the allotted period of quarantine, were refugees permitted to pass through the outer cordon into the State?

8. Was contagion carried to any other cities by such refugees as were released from the cordon quarantine?

9. Who were appointed as cordon guards and officials, Democrats or Republicans? Do you think politics effected such choice and appointments?

10. By what officers was the money for the disbursement of cordon distributed?

11. Was there any just suspicion that the funds were used for political ends? If so what evidence of it?

12. Did the disease spread within the two lines of cordon in the camps to any extent?

13. Did the establishment of the cordon remove the expense of quarantine against Brownsville by other cities, or did it reduce such expense?

14. What is your opinion of the efficiency of the cordon?

15. Do you think that its establishment was wise?

16. Do you think that the effects of the cordon had anything to do with the stamping out of the fever?

17. Do you think that without the cordon and its influence the plague of yellow fever would have been any more severe?

I am doubtless putting you to some trouble to answer these questions, but you will greatly oblige by so doing, at your earliest convenience.

Very respectfully yours,

(Signed.) J. M. TARBLE,
Mayor of Pensacola, Fla.

OFFICE OF THOS. CARSON, MAYOR,
BROWNSVILLE, TEXAS, *Nov.* 14, 1882.

HON. J. M. TARBLE, *Mayor of Pensacola, Fla.*,

Sir:—The quarantine which has been maintained against this place since the 29th of July, 1882, prevented an earlier acknowledgement of your letter of Oct. 11, in which you ask me to give you the experience of our city with yellow fever and the results obtained by the Cordon. The further enquiries in your letter which I have endeavored to answer catigorically, as per enclosed herewith, disclose a desire to ascertain how far we were benefited by the action of the Marine Hospital Department in relation to the epidemic. From my answers to your questions you will readily perceive that, in my opinion, this community received no benefit from that institution other than that involved in the employment of some thirty persons (who would probably otherwise have been idle) as quarantine or cordon guards, and in the personal services of three of the physicians who accompanied Dr. Murray to Brownsville as assistants. For a short period after his arrival Dr. Murray's personal service, as a physician attending the sick, was also of great value; but on the establishment of his cordon, his entire time appeared to be occupied by matters in connection with that duty.

As an offset to those benefits and advantages, we had the arbitrary assumption of control of quarantine matters by Dr. Murray, and his attempt to override the local health authorities, the inconvenience of the useless restrictions imposed by the cordon, and the injury caused by that institution, when, as our election day approached, it drifted into a mere political machine, and was used for the purpose of facilitating the election interest of candidates, supported by the Custom House of this district. Two days after the election it was disbanded; on election day sixteen of its members were interested as candidates or occupied as supervisors of election and deputy marshals, and the remainder as runners or supporters, all, however, on the same site. Yours truly,

(Signed) THOMAS CARSON.

Answer No. 1.—No tender of assistance was made to our city by the Marine Hospital Service. In response to our application to the Secretary of the Treasury, and after considerable telegraphic correspondence (copies herewith marked *a*), Dr. Murray, of that service, and three assistant physicians were sent here, bringing, also, one female and six male persons as nurses. Dr. Murray also brought some medicines and hospital supplies, the former consisting chiefly of some 300 ounce bottles of pulverized charcoal, but no quinine, except a small supply of three to five grain pills. He also brought as fumigatory material, eight barrels of copperas, five barrels roll sulphur, and two barrels diluted carbolic acid.

The hospital supplies were mainly a dozen boxes of lemons, two dozen champaigne, and four boxes of other wines and liquors. The mustard he brought was found to be damaged and worthless. He brought, also, two small hospital tents, capable of containing six cots each, twelve cots, but no beds, mattresses, nor bed clothing.

Previous to the arrival of this Marine Hospital contingent our Citizens' Relief Committee had established a hospital in a large brick, two-story building, used for school purposes and generously placed at the disposal of the committee by its owners, the Catholic clergymen of this city. This building, known as St. Joseph College, the committee had fitted up with twenty-four beds, had provided it with a matron and nurses, and placed it in charge of one of our local physicians, assisted by all the medical men of the city as required. At the time of Dr. Murray's arrival it contained fourteen yellow fever patients. Dr. Murray stated to the Relief Committee his williness and desire to take charge of *all* the sick, leaving the committee to provide only for the destitute. On this the hospital was turned over to him with all its appliances. He discharged the nurses and replaced them with those he brought. Before the second day it was found his nurses were chiefly a lot of drunken rowdies, picked up, apparently, at hap-hazard in Galveston, and their treatment of the sick was such that the Mexican people, who had commenced to appreciate the advantages afforded by the hospital, and were beginning to avail themselves of its comforts, became alarmed, and would not permit their sick to be sent their. The result was, that in a building capable of accommodating two hundred sick, there were never more than twenty-four patients while the Marine Hospital people had charge of it, and during most of that period there was an average of over six hundred yellow fever cases in the town.

Digitized by Google

Instead of taking charge of all the sick, as Dr. Murray stated his williness and ability to do on his arrival, as well as supply all needed medicines, he announced three or four days after he came here that he could only attend to and provide medicines for those in the hospital, or about 3 per cent. of the people under treatment. This was after his Galveston nurses had made the hospital a place of terror to the sick poor. On this I, as Mayor, wired the Surgeon-General, as per telegram annexed marked *B*, and to which, to this day, I have received no reply. But we saw that we could not rely on the Marine Hospital Department for any relief for our stricken people, and we authorized the Governor of Texas to state our case to our fellow countrymen. Their noble response from all quarters of the Union enabled the Relief Committee to save—I do not hesitate to say—hundreds of lives; not alone from the jaws of the pestilence, but from the not less deadly menace of hunger and starvation.

These are the simple facts in the case, and you can gather from them the value of the service of the Marine Hospital Department to the afflicted people of Brownsville in their recent trial.

Answer No. 2—On the 29th of July we declared quarantine against Matamoras, Mexico. On the 4th of August the disease was declared epidemic in Brownsville.

The main hospital contingent arrived in Brownsville on the 28th of August, and Dr. Murray organized his cordon about the 3d of September, thirty days after the disease had been declared epidemic here.

Answer No. 3.—From small beginnings, which were overlooked because of the attention of the officials being engrossed in caring for the sick and destitute, Dr. Murray gradually assumed supreme and exclusive control in quarantine matters. Citizens were required to have his passport to enable them to leave the country for Mexico, and were prohibited coming back at all; no provision was made by him for keeping persons in quarantine or isolation, he simply declared non-intercourse, and when the local authorities sought to mend the situation, he scouted their authority, threatened to bring United States troops to sustain his pretentions.

Driven from this position he practically retired from the town, but continued to exercise despotic authority on the line of this cordon.

Answer No. 4.—In no way save as indicated in my answer to your first question.

Answer No. 5.—There were no refuges within the lines of cordon established by Dr. Murray. A person desiring to go outside the line of the cordon proceeded on his journey the usual way. If he met a cordon guard he was informed he could not go further unless he remained at one of two designated points (about thirty miles apart), for ten days. At each of these two points a house was provided, but no provisions or anything but mere shelter. So far as I can learn about six person availed themselves of those provisions to get through the cordon during the entire period of its existence—say from Sept. 3d to Nov. 9th.

Answer No. 6.—No people were removed from the city by the cordon authorities; nearly all the people who desired to leave town did so within a week or two after the disease was declared epidemic. Some of them went into voluntary quarantine in order to pass into other counties.

Answer No. 7.—Yes, in the six cases, more or less, referred to in my answer to 5th question.

Answer No. 8.—There is no record that the disease was carried anywhere else from Brownsville by parties leaving this town, either before or after the establishment of the cordon. The disease spread among the adjacent ranches (say within fourteen to fifteen miles) but was rarely fatal among them.

Answer No. 9.—Young men, principally of Brownsville, nearly all "floaters," as regards political faith at the time of appointment. I don't think Dr. Murray had any view of their politics, but they were named by the Deputy Collector of Customs, the leader of the Ochiltree movement here, and the cordon guards to a man supported Ochiltree, the Republican candidate.

Answer No. 10.—The guards are not yet paid. The money, I understand, comes to the Collector of Customs, after receipted pay rolls are forwarded.

Answer No. 11.—As to this question you must conclude from foregoing answers. Republican canvassers could pass the cordon guards with little or no detention. Democratic ones could not.

Answer No. 12.—Question not clearly understood. There were no camps except that of the troops from Fort Brown.

There was, for a time, a line of cordon guards on the river, to prevent people crossing from Mexico. Those were withdrawn about Oct. 31, and placed on the line of the Arrozo, Colorado, about thirty miles north of Brownsville. There was another line of cordon one hundred and forty miles north of the Arrozo, Colorado. I have heard of very little disease between or beyond those lines. Not over a dozen cases.

Answer No. 13.—Not a dollar; it had no effect whatever.

Answer No. 14.—The line guarded in this country was in all about seventy miles long, and there were twenty-eight guards on it. Most of them knew nothing of the topography of the country. From this fact you can judge of its efficiency in preventing parties passing beyond it.

Only the few people (the half-dozen before referred to) who were well-known and could not conceal their identity or whence they came when beyond the lines, troubled themselves about the cordon in passing out.

Answer No. 15.—No; the money it cost could have been more usefully applied.

Answer No. 16.—In my opinion, and from close observation of its working, not even in a remote degree.

Ansuer No. 17.—It had no effect in yellow fever locality, and I am most thoroughly convinced had nothing to do with its spreading and limitation.

INSTRUCTING A PLUMBING CLASS.

For all who are concerned about the practical instruction of plumbers the list of questions which we reprint below from the course of the New York Trade Schools, will be of interest. Slips containing these questions are prepared and distributed among the young men attending the school. The instructor then bases his remarks upon them, using a black board to write the questions on and their answers, while he, at the same time, gives such explanations to the class as may be neccessary to make the answers entirely clear. In this way it is sought to fix the instruction in the minds of the scholars as it could not otherwise be. The questions on this slip referred to boilers.

1. Of what metals are boilers usually made?
2. How much should a copper 40-gallon boiler weigh?
3. How much should one of 60 gallons weigh?
4. How much should one of iron weigh for 40 gallons?
5. How much if 60 gallons?
6. How are they usually placed?
7. Is it of any consequence where they are placed?
8. Where should cold water supply pipe enter boiler?
9. How should circulating pipes between boiler and water-back be arranged?
10. Is there any advantage in having hot circulating pipe larger than the cold one?
11. What causes the rumbling sound in boilers?
12. What is the usual cause of explosion in a water-back?
13. When the water in a boiler is generating steam rapidly, what effect may drawing off the hot water have?
14. Why does this condensation of steam endanger a boiler?
15. What is the pressure of the atmosphere?
16. Is a collapse more likely to happen when the water pressure is light?
17. What is the usual safeguard against explosion of a boiler?
18. Can the hot water service pipe be used in this way?
19. Are wrought iron boilers stronger than copper, and why are they used?
20. What cold water pressure will the average copper boiler stand?
21. What is likely to be the greatest heat of the water in a 40-gallon boiler in an average plumbed three-story house, with the hot service pipe returned to the boiler to keep a circulation through the pipes?
22. What is the heat of steam?
23. What is superheated steam?
24. Does this change its nature?
25. Is there any possibility of steam in the boiler of a dwelling house becoming superheated?
26. Do boilers get dirty—and why?
27. Does the drain cock at the bottom cleanse them?
28. What plan can be adopted to do so?
29. How does this act?
30. Can water tanks in any part of the house be connected with water-back instead of having a boiler?
31. Is it necessary to cover such tanks and have an escape pipe for steam?
32. Copper boilers have a tinned copper cold water pipe in them; is any precaution advisable in regard to this pipe?
33. What is the object of this?
34. Is there any objection to placing a stop cock between boiler and water-back?
35. What is the object of a double boiler?
36. What is gained by this?
37. Is it necessary to connect both boilers with water-back?
38. If the water from inner boiler is drawn off, what danger is incurred?
39. Can the return pipe be taken below the boiler?
40. Is there any objections to having the water pass through the water-back of two ranges?
41. Which is best for the pipe between boiler and water-back, lead or iron, and why?
42. What is the best size?
43. What ill effect comes of putting the upper pipe from water-back into the boiler at a point lower than water-back?

1. *Make a diagram of kitchen boiler, connected with water-back.*
2. *Make diagram of a slung boiler.*
3. *Make a diagram connecting one boiler with two ranges.*
4. *Make diagram of a double boiler contected with range.*

AN INVESTIGATION DEMANDED.

DEPT. OF PUBLIC WORKS, COMMISSIONER'S OFFICE,
No. 31 CHAMBERS ST., NEW YORK, *Jan.* 31, 1883.

HON. FRANKLIN EDSON, *Mayor*:

SIR: From the newspaper reports of the proceedings of the Committee which you have associated with yourself, under a recent resolution of the State Senate, to inquire into the subject of providing an additional water supply for the city, I find that one of the witnesses, a Mr. James E. Sewell, Civil Engineer, or Surveyor, submitted certain questions and made certain statements regarding the depth and flow of water in the Croton Aqueduct (which are matters of continuous public record in this department), from which he appears to draw the conclusion and make the charge that the water supply is so manipulated as to withhold a considerable quantity of the water, which might otherwise be delivered in the city through the aqueduct.

The charge or imputation that the department is purposely withholding or wasting a portion of the available water supply is so unfounded and absurd that on first thought I did not intend to notice it. On further reflection, however, considering the gravity of the accusation, the publicity which has been given to it, and the erroneous impression which it might create with some people not acquainted with the circumstances, I have come to the conclusion to address this letter to you, requesting you and the Committee to make the fullest inquiry to establish in an important and authoritative manner the true facts in this matter. And, in making this request, I place at the disposal of yourself and the Committee all the records, maps, and information in the possession of the department, and all the aid which the department engineers can render to facilitate the inquiry, suggesting, at the same time, that a personal examination of the aqueduct and reservoir by yourself and the Committee would be the surest method to ascertain such facts.

Asking early action on this request, I am,

Very respectfully,

Signed HUBERT O. THOMPSON,
Commissioner of Public Works.

"A prominent gentleman of the Fourth Ward" of Syracuse, N. Y., who was interviewed by a reporter lately, seems to be a sensible man. Onondaga Creek, which flows through the city, receives all refuse and sewage. Consequently it is nasty and not unlike the Nepperban at Yonkers. The gentleman referred to, when asked what he thought would have to be done about it, replied:

"Some persons have proposed to plank the bottom of the creek, some to wall up its sides, some to arch it over with stone; but all these plans have been abandoned as not furnishing an adequate remedy. Although I am not a civil engineer, I have given this subject sufficient thought to warrant me in suggesting a plan. I would have a trunk sewer built on each side of the creek, near or remote as shall be most practicable, beginning at Onondaga street and emptying into the creek below the thickly inhabited part of the city. Into these new sewers should be conducted all the sewage now flowing into the creek. In that way the waters of the creek could be kept pure, the outlets of the present sewers would not be obstructed as they now are in time of freshets, often forcing back into cellars and basements the contents of the sewers, and under the proposed system the outlets of the present sewers would be under ground. Then, too, the proposed sewers could be constructed so low that all lateral sewers would have a lower outlet, and thus a better flow, and from time to time sufficient water could be drawn into them from the creek to give them a thorough cleaning out. Of course two such sewers will cost a large sum of money, but I regard them as absolutely necessary as a sanitary measure and believe that they can't be built any too quickly."

Novelties.

Under this heading we propose to supplement our section on patents by descriptions and illustrations of new appliances put on the market. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity and probable interest to readers, and especially the fact that they have not been elsewhere described As a rule we shall make no comments, and IT IS TO BE DISTINCTLY UNDERSTOOD THAT A NOTICE DOES NOT IMPLY APPROVAL. *No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.*

PIPE-THAWING MACHINE.

This description was suggested by the letter of a foreign correspondent, who asks us to illustrate the device used in the United States for thawing out frozen water pipes. This apparatus, though not a "novelty" in principle, is the first we have seen in the market. Heretofore plumbers in this city have provided themselves with "steam kettles" of different patterns, though essentially the same. They are generally adapted in form to rest on a charcoal furnace such as plumbers use for melting lead, and consist simply of a chamber for the generation of steam, a pipe extending nearly to the bottom, with a funnel on top for the introduction of water, an outlet for the steam, a safety valve and gauge-cocks. The form illustrated below, as manufactured by Mr. John Trageser, of 273 Pearl street, this city, is of galvanized iron with brass fittings.

The steam is used to thaw frozen pipes by applying it directly to the ice inside by means of a smaller pipe connected with the steam chamber and moved along inside the frozen pipe as fast as the ice melts and as far as it will readily go. Three-eighths or one-half-inch lead pipe is generally used, being connected with the steam chamber by rubber tubing. The latter, stiffened by winding brass wire around it spirally, can be inserted much greater distances, but this is patented and not much used in this city. The metal pipe ordinarily used here cannot be inserted very far in pipes having many sharp curves. The frozen pipe is cut and the thawing begun anew when the steam pipe can be pushed no farther.

Construction Notes.

WELLESLEY, MASS.—At a town meeting the 15th ult., it was voted to apply to the State Legislature for an act to introduce water into the town. It has been suggested that a supply can be obtained either from Natick or Newton.

BUFFALO, N. Y.—Bids for constructing the trunk sewer were handed in February 20. They ranged from $703,303 to $1,323,572. The work was bid for in eight sections, and the sum of the lowest section bids, which will be the actual lettings, is $624,777.

EVANSTON, ILL.—The trustees of South Evanston have ordered an appropriation of $25,000 for the new water works.

HYDE PARK, ILL.—The Board of Trustees awarded, February 21, to Michael Clarkson, the contract to lay a 16-inch water main from the pumping works to Ninety-fifth street and Commercial avenue at $1.10 per lineal foot.

CHICAGO.—The County Board awarded, February 19, to Bufton & Boyd, at their bid of $10,348, the contract for improving the ventilation and sewerage in the jail and criminal court.

NEW ORLEANS.—The Board of State Engineers, the 14th inst., annulled the contract made last November with Thomas O'Malley for the construction of levees on the Atchafalaza river, and turned the work over to S. L. James. The New Orleans *Picayune* states that the work amounted to 115,000 cubic yards of embankment for which the State was to pay 27 cents per yard.

CONTRACTS AWARDED IN PHILADELPHIA.

Contracts have been awarded by the Highway Department for the construction of the following sewers:

A branch sewer on Cambria street, from D street to Rorer street. and on Rorer street from Cambria northward 250 feet, to G. H. Miller, at $2.50 per foot and $25 per man-hole.

A branch sewer on Commerce street from Rose street to the sewer in Adams street, and on Rose street from Almond street to Commerce, to W. B. McConklin, at $2.44 per foot and $25 per man-hole.

A branch sewer on Baring street from Thirty-second street westward 195 feet, to W. H. H. Achuff, at $2.43 per foot and $25 per man-hole.

Branch sewer on Washington avenue from sewer east of Front street and extending westward to west side of Front, to W. B. Conklin, at $2.33 per foot and $25 per man-hole.

Branch sewer on Twenty-second street from Chestnut to Sansom, to W. B. M. Conklin, at $2.73 per foot and $19 per man-hole.

Branch sewer on Marshall street from Venango street to Erie avenue, to W. Armstrong, at $3.65 per foot and $25 per man-hole.

Branch sewer on Mountain street from Eighth to Ninth, to W. B. M. Conklin, at $2.33 per foot and $25 per man-hole.

Main sewer on Forty-seventh street from about 150 feet north of Aspen southward 1,000 feet, more or less, to W. H. Achuff at $44.75 per foot; the latter is a continuation of the Mill Creek sewer.

WATER WORKS FOR ROSCOMMON, MICH.—A system of water works has been selected by the village board, and will be submitted to a vote of the electors at the coming village election on second Tuesday in March, and, if carried, the system will be immediately introduced. The estimate of the board of cost of these works, for fire protection and for furnishing all who may need water is $7,000. The plan is to let the contract to Flint, Walling & Co., of Indiana, to erect a large tank, capable of holding 1,100 barrels, at an elevation of 40 feet above the base, erected on an elevation, with a large windmill with a ten-foot stroke, and a pump to get the water into this tank, located close to a large stream (Robinson Creek), the stream and tank being connected by a pipe. Pipe ranging from three to six inches in diameter will be laid along the principal streets, at a depth below the surface sufficient to insure the water from frost. Hydrants will be located at every corner of a street where it is deemed necessary for protection. About 1,000 feet of hose will be bought with three hose wagons. An office will be erected for a council room, using the lower part for a hose house. As the liquor tax amounts to about $3,300 per year, it is thought this outlay can be met and liquidated from this fund, without any further tax on the people.—*Engineering News.*

OAKLAND, CAL.—An ordinance granting to J. G. Diroll and W. G. Long the right to lay water pipes in the streets, has been signed by the mayor.

GLOUCESTER, N. J.—Contracts have been awarded in the matter of the water works as follows: For subsiding reservoir to John E. Eschbach, at $5,600; for pipe system complete to John E. Eschbach, at $34,534.81; foundation of water tower to Leaming, at $2,275; Engine house to Leaming, at $5,565.97; water tower to John Baizley, at $5,870; engines to Robt. Watherill and Co., Chester Pa., $14,550; fire protection, $2,500.

WATERBURY, CT.—The Sewer Commissioners had a hearing January 26, on taking land for sewerage purposes.

CUSTOM HOUSE AND POST OFFICE AT HARTFORD, CONN.—Synopsis of bids for furnishing and setting the granite street curbing for approaches, received under advertisement of Jan. 16, 1883, and opened Jan. 26, 1883:

Mt. Waldo Granite Co	$945 00
M. H. St. John	1,100 00
Bodwell Granite Co	950 00

CUSTOM HOUSE AND POST OFFICE, HARTFORD, CONN.—Synopsis of bids for Granolithic Pavement for approaches, received under advertisement of Jan. 16, 1883, and opened Jan. 26, 1883.

M. Taylor	$2,340 00
H. L. Cranford	2,370 00
L. S. Filbert	2,425 00

BROWNWOOD, TEX.—The Commissioners' Court have ordered a sewer built from Court House Square to Pecan Bayou, a distance of two miles. Bids will be received at their next meeting.

SCHAGHTICOKE.—The President of the village, and other residents, conferred with the State Board of Health and representatives of the Boston, Hoosac Tunnel and Western Railway, at Albany the 11th ult., on abating the nuisance in the Hoosick River. The railroad agreed to undertake all the work specified by the Board of Health.

CONTRACTS AWARDED BY NEW YORK DEPARTMENTS.

The following lowest bids were received at the Department of Public Works on the 21st ult.:

For regulating and grading Tenth avenue between 93d and 95th streets, and setting curbstones and flagging sidewalks therein: Thomas Casey, $3,856.25.

For the same work on 122d street from Fourth to Madison avenue, John Rhelan, $18.139.50.

For the same work on 136th street between Sixth and Seventh avenues, Patrick Farley, $6,451.

For the same work on 141st street, between Eighth and St. Nicholas avenues, James Reilly, $4,440.50.

For flagging sidewalks, four feet wide, on Third avenue between 93d and 101st streets, J. D. Moore, $2,548.25.

For same work on Ninth avenue between 64th and 71st streets: B. Mahon, $4,257.

For laying water mains in Jerome avenue from Sedgwick avenue, 8,000 feet north, T. E. Crimmins, $24,011.

For laying water main in Alexander, Myrtle, Valentine and other avenues and streets in the northern part of the city, John Cornwell & John Cornwell, Jr., $16,755.

For furnishing cast-iron water-pipe, branches and special castings, the following bids were received:

	First lot.	*Second lot.*
Florence Iron Works	$55,410.	$57,540
Warren Foundry & Machine Co	52,770.	56,580
Theo. Sturges	55,963.50.	59,320

The Romapo Improvement Company, for the improvement of the Romapo River, in the State of New York, for manufacturing purposes, and also for furnishing, accumulating, storing, conduiting, selling and supplying water for various purposes, was incorporated Feb. 14 with a capital of $10.000,000.

A bill incoporating the Alachua Drainage and Reclamation Company, was introduced into the Florida Senate the 26th ult.

Waterbury, Conn., made $28,452.12 out of its water works last year. This amount came out of 2,217 consumers, who paid all the expenses of maintaining the works in addition. It seems pretty hard on water takers that they should be compelled to assist in the reduction of the taxes and insurance of their fellow citizens to so large an extent. The expenses of maintaining the works were $5,728.06, or about $2.58 per consumer. But in addition to this, each one paid the city $12.83 for that which all his fellow citizens shared with him—the protection to property and the comforts of a general supply of fresh, wholesome water.

The City of Indianapolis, Ind., came very near being placed in a position of great danger last week. The White River rose rapidly until the water was a foot deep on the floor of the engine house containing the pumps which supply water to the city. As the direct supply system is used there, a very slight additional rise would have cut off the water supply entirely, by extinguishing the fires under the boilers.

A resolution passed the Select Council of Philadelphia the 23d ult., authorizing the Commissioners of Fairmount Park to institute legal proceedings against all persons polluting the water of the Schuylkill above Fairmount dam, whenever they deem it necessary to do so.

THE CHICAGO MASTER PLUMBERS.

(From our Special Correspondent.)

CHICAGO, FEB. 15.—About forty members of the Master Plumbers Association were present at the regular meeting to-night, the feature of the evening being an illustrated lecture or familiar talk on the subject of "The Circulation of Water in Range Boilers." The speaker, Mr. Creque, of Creque, Ronalds & Co., New York, was introduced by President D. J. Rock, and for three hours held the floor to the evident interest of the Association, a good part of the time answering the questions that were asked him liberally. The sense of the meeting was expressed in resolutions unanimously adopted endorsing the system of fitting up boilers advocated by Mr. Creque.

The Association offered the following advice to all householders:

"A cast-iron water-back is known by all practical plumbers as the most dangerous. When an explosion occurs it flies all to pieces, carrying death and destruction with it, while on the contrary we know of no fatal results by the bursting of wrought-iron pipe water-backs. To prevent water-back explosions, before you light the fire in the morning in your kitchen stove, apply a burning newspaper to every part of the connecting pipe between stove and boiler. Hold the blaze longer close to the boiler and stove. Repeat this several times. A spirit-lamp or hot water will serve the same purpose as burning newspaper. As a simple indicator place an open vessel of water as near the pipe connection of the water-back as possible; if ice forms in the vessel during the night do not start a fire in the kitchen stove until you apply one of the above remedies. In cold weather, if you keep a fire burning in the kitchen stove day and night, this will insure you against any damage from water-back explosions."

PLUMBING LAW VIOLATIONS.

Fifteen trivial cases of violation of the plumbing regulations were reported last week to the Health Department of this city by the plumbing inspectors, as follows: Hooper one; Eagleson and Golden two each; Elliot four, and Hollick six. One more serious case was reported by Inspector Elliot.

The American Institute of Mining Engineers elected the following officers at their meeting in Boston last week: President, Robert M. Hunt, of Troy, N. Y.; vice-presidents—two years—S. F. Emmons, of Denver, Col.; W. C. Kerr, of Washington, D. C.; S. F. Wellman, of Cleveland, O.; managers—three years—John Birkinbine, of Philadelphia, Pa.; Stuart M. Buck, of Coalburg, Western Virginia.

The imminent danger of a complete deprivation of water to which Cincinnati has been exposed, will doubtless cause renewed discussion of projects for a different source of supply. The whole question has been so befogged by counter statements of the most positive and acrimonious type, that it is not easy for an outside observer to say where or how the new water supply should be procured. One thing, however, is very certain, from the events of the past ten days, and that is, that ample reservoir capacity is absolutely essential for a town situated on a stream, the waters of which may rise at any time to such a height as to flood pumping machinery and extinguish furnace fires.

A correspondent of the *London Globe*, writing about the indifference of the Oriental to filth, says that they regard the pollution of wells with unconcern which is amazing. Most natives, even of the highest caste, have no objection to use, both for domestic and drinking purposes, water which may be described as simply filthy. People wash their clothes and themselves in tanks from which the women take home water for cooking and drinking. The only desideratum is that the water shall be "soft." In some places it has been found useful to set apart by municipal authority certain tanks for washing, and others for the supply of drinking water, but the regulation can only be carried out by appointing watchmen to enforce it. Satisfactory progress has been made in improving the water supply of the great cities, and it would seem that as regards some of these there is not now very much to complain of. An example of the danger incurred by English soldiers from drinking impure water is afforded by an instance reported from Kamptee. A detachment of the 2d battalion of the 13th regiment stationed there suffered from an outbreak of enteric fever. It was speedily noticed that nearly all the patients were teetotallers, and it turned out that the teetotal soldiers had a recreation room of their own, where they drank tea, coffee, ærated waters, and what was supposed to be pure water. On examination, however, it was found that the latter fluid was drawn from a well close at hand, which had been polluted by percolation from neighboring drains. The other men had not drunk from this well, and nearly all escaped the epidemic.

IRON DRAIN PIPES WITH LEAD JOINTS.

Mr. B. H. Thwaite writes: "If iron is brought into contact with lead, galvanic action is at once established, and as the lead is electro-negative to the iron, it is preserved at the expense of the latter; the electrolytic action produces, near the point of contact of the metals, tubercular corrosive action or pitting. The writer has several examples of iron which exhibit the abnormal local oxidation mentioned, and nothing but the electrolytic action, in these instances, could have caused such an abnormal degree of pitting oxidation. A close observation of some old iron raillngs, fastened in lead, will clearly exhibit this phenomenon of local oxidation. The writer has seen iron railings which have actually corroded to a thread at the point of contact, while the upper part of the railing exhibited very little corrosive action. These railings were only subjected to the corrosive influences of the atmosphere of a town; what would, therefore, be the corrosive effect of the contact of lead and iron when subjected to the exciting solutions of ammonia and other acids contained in sewage? The writer has seen ordinary water pipes after a few years exposure, which were a comple'e mass of hydrated sesquioxide, the accumulation of rust having entirely choked them. The writer would be glad to know from Mr. Burton the result of any examination of lead-jointed iron drain pipes, which have been in use for several years. Judging from experience, the writer fancies, that, if the iron pipes before being fixed have not been rendered rustless, they would be found to be almost entirely corroded away, at least, near the lead joints.—*Journal of the Society of Arts.*

ONE OF THE NOT ENFORCED ORDINANCES.

Title 5 relates to the prevention of fires, and contains ordinances from 89 to 110 inclusive. It contains besides the fire limits ordinance, other ordinances requiring semi-annual inspection of all buildings in the city, stove pipes, stoves, chimneys, hearths, etc. Some of the ordinances are out of date, but many of them are good and should be enforced, especially the one in relation to inspection. This should be made the duty of the chief engineer and his assistants, and the enforcement of the ordinances in Title 5 should be made the duty of the regularly employed firemen.—*Utica, N. Y., Herald.*

During December 1882, the average daily consumption of Water in Edinburgh, Scotland, was 13,964,387 gallons, or 43 gallons per head of population supplied. During a very cold spell, at least 5,704,000 gallons per day were wasted by leaving the water running to prevent freezing, and it is stated that the parties who deliberately wasted the most water were the most persistent complainers of the inconvenience that resulted from the lack of pressure in the mains, which was caused by the waste. In this respect, the citizens of Edinburgh and New York are very much alike.

Our readers will feel better satisfied in the stomach to learn that the report that the sewage of the Lunatic Asylum is emptied into the Delaware is untrue.—*Trenton State Gazette.*

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

E. G. LOVE, Ph.D., *Gas Examiner.*

Meter-ites.

London *Post* says a petroleum well has been struck at the Elm Colliery, Buckley, Flintshire.

The Standard Gas Light and Coke Company of Xenia, O., was incorporated the 1st inst. Capital $50,000.

Another gasoline explosion is reported from Amsterdam, N. Y., which wrecked a building of S. Blaisdell, Jr. & Co.'s. knitting mills.

President Hickenlooper of the Cincinnati Gas Company has petitioned the Board of Public Works for such an alteration of grades of street as will elevate the proposed new gas works two feet higher than was first set, in consequence of experience gained by the recent floods.

The New Orleans *Picayune* demands the repeal of the ordinance granting a franchise to the Light and Heat producing company, for the reason, among others, that it is so framed it does not bind the company to ever do anything, and gives the parties the right to sell out again, if they can get hold of another patent.

The New England Association of Gas Engineers met at Young's Hotel, Boston, last week, and elected the following officers: President, A. B. Slater, of Providence, R. I.; Vice-Presidents, M. S. Greenough, of Boston, and J. P. Harrison, of Hartford, Conn.; Directors, A. M. Morton, of Nashua, N. H.; S. G. Stevens, of Pawtucket, R. I.; Wm. Yorke of Portland, Me.; J. S. Hallett, of Springfield, Mass.; C. H. Nettleton, of Birmingham, Ct.; Secretary and Treasurer, George B. Neal, of Boston.

As a result of the recent argument before the Attorney-General in the matter of Stewart & Boardman representing George William Curtis and other residents and property-owners of Staten Island against the Standard Oil Company, the defendants, through their counsel, Scudder & Carter, have stipulated to waive any immunity on account of their being a New Jersey corporation, to put themselves under the supervision of the New York State Board of Health, and to adopt all possible devices for abating the nuisances complained of. The stipulation has been accepted and the complaint has been withdrawn as far as the Standard Oil Company is concerned.—*Tribune.*

ELECTRIC LIGHT NOTES.

One hundred and fifty Edison lamps are used in the new building of the Boston *Advertiser.*

The Electric Lighting Company of Omaha started with lighting 40 arc lights in business houses the 27th ult.

The American Electric Light Company, now of Hartford, will transfer their headquarters to Lynn, Mass., where they will erect works at once.

The Brush Electric Light Company will introduce their storage batteries for house lighting into New Orleans. It was "formally opened to the public" in Chicago the 21st ult.

The Austrian Minister has informed the Secretary of State that the International Electrical Exhibition to be held at Vienna, in August, September and October next, though a private undertaking, has been sanctioned by the Austrian Government. It is also stated that though applications for space should, according to the regulations, be made before March 1, yet American exhibitors can be accomodated after that date.

A soap mine has been discovered in California. The substance is a deposit of white earth, free from grit, and impregnated with a small percentage of potash. It is easily sliced into bars, and, for cleaning purposes, is a fair substitute for manufactured soap.

Food and Drugs.

CONFERENCE OF MANUFACTURERS WITH NEW YORK STATE BOARD OF HEALTH.

The New York State Board of Health held a special and important meeting at the School of Mines, Columbia College, in this city, on Saturday, the 24th inst. There were present Dr. Moore, the President, Hon. Erastus Brooks, Dr. Delevan, Dr. Wm. M. Smith, Prof. Gardner, Prof. Chas. F. Chandler and Dr. Elisha Harris, the Secretary.

The special purpose of this meeting was to enable manufacturers and dealers in food and drugs to be present and give their views with regard to contemplated rulings touching articles to be sold as mixtures, and the conditions to be imposed.

A representative of the Retail Grocers' Union desired to know if the Board would avail themselves of the services of retail dealers in prosecuting wholesale merchants who sold them adulterated goods. He was given to understand that in cases where the Board were satisfied the witness was acting in good faith they would be glad to avail themselves of his assistance. A few speakers dwelt entirely on what they considered a hardship, in not being permitted to manufacture fraudulent articles, because persons were permitted to do it in other States, and they thought that capital thus employed would be driven from the State. The sentiment of the majority of those present, as expressed, was favorable to the adulteration law and its enforcement.

The following questions were offered and voted upon by the manufacturers and dealers in food products who were present:

1st. Is it proper to permit the use of harmless coloring matter in mustard mixtures?

The vote was unanimously in the affirmative.

2d. Should all the component parts of a mixture be printed upon the label?

The vote was unanimously in the affirmative.

3d. Should the percentage of each and every constituent of the mixture be printed on the label?

The vote was unanimously in the negative.

4th. Should the percentage of the leading or characteristic constituents of a mixture be printed upon the label?

The vote was in the affirmative.

5th. The question of requiring that the labels for each particular mixture be submitted to the State Board of Health for approval was discussed, and the manufacturers present approved of the proposition.

After the conference the Board met and passed the following resolutions:

On motion it was

Resolved, That the resolution with regard to mixtures of mustard and coffee, adopted at the meeting, held on January 6, 1883, be amended so as to read as follows:

Resolved, That under and pursuant to Sec. 4, of Chap. 407 of the laws of 1881, the following mixiures, when distinctly labelled in the manner provided in sub-division 7 of Sec. 3 of said Act, are within the conditions hereinafter prescribed, declared to be exempt and permitted to be sold under the provisions of the said Act.

1st. Coffee mixtures containing no other substances except chiccory, peas or cereals, and in which mixtures the pure coffee shall not be less than 50 per cent. of the whole mixture or compound, provided the exact percentage of coffee be printed upon the label of each package.

2d. Mustard mixtures with wheat or rice flower to which no other substance, or article, or any coloring matter except turmeric is added, and in which the pure farina of mustard shall not be less than 40 per cent. of the whole mixture or compound, exclusive of the mustard hulls.

The labels on the above mixtures shall contain the names of each and every ingredient of the mixture.

The labels shall also exhibit the percentage of the characteristic constituents; for example, the percentage of coffee in the coffee mixture, and the percentage of mustard in the mustard mixture.

The above mentioned information shall be printed on the labels in black ink, in legible antique type of a size easily to be read on one side of the package.

Resolved, That this Board regrets to learn that a bill to permit the sale of skimmed milk has been presented to the Legislature.

That in its opinion this bill, if it should become a law, would seem no additional protection against the sale of impure or unwholesome milk; existing laws having been found entirely adequate for this purpose.

While such a law would seem no additional protection, experience in other States has shown that it would practically paralyze the State and local boards of health in regulating the sale of milk.

Resolved, That the Secretary be directed to send copies of these resolutions to the President of the Senate and to the Speaker of the Assembly.

A NEW TRIAL ORDERED IN A TEST CASE.

Judge Cowing yesterday rendered a decision, in the appeal from the Court of Special Sessions, in the case of Henry Fulle, a grocer of No. 823 Second avenue, who was fined $10 on January 9 on a charge of selling adulterated cream of tartar. The cream of tartar bought of Fulle was found to contain ninety-two parts of ground gypsum and eight parts of tartaric acid. Judge Cowing sets aside the judgment of the Court of Special Sessions, and orders a new trial on the grounds that the cream of tartar was sold as an article of food and not as a drug, as charged in the complaint, and that the defendant had no criminal intent, as when he bought the cream of tartar he inquired for the best article in the market and paid the highest market price.—*Tribune, Feb.* 24.

[We shall consider the points made by Judge Cowing's decision at another time, though we do not believe it affects the law or the other cases to be tried.]

A WEAK CASE.

NEW YORK, *Feb.* 23, 1883.

To the Editor of THE SANITARY ENGINEER:

Will you kindly give me your opinion as to the probable action of the State Board of Health in a case like the following: Suppose I ask a grocer for one pound of coffee, and instead of coffee he gives me a mixture of coffee and chicory, which is labelled as a mixture, but the label of which I do not notice until after leaving the store. Nothing is said by either party during the purchase. Is the grocer liable to prosecution? In other words, is the purchaser obliged to read the printing on the label? Suppose he cannot read? Z.

[We should suppose that the Board would select cases for prosecution more likely to result in a verdict against the defendant.]

A bill introduced in the California Senate the 6th ult., makes it a "misdemeanor for any person to sell or expose for sale any milk that does not contain all the essential properties of average country milk in their just proportions; every person who shall have in his possession for sale, or who shall sell milk from which the cream or any part thereof has been removed, shall likewise be guilty of a misdemeaner, as likewise persons selling swill milk, or milk produced from cows fed on distillery-slops."

In the House of Representatives, of Massachusetts, the committee on public health have under consideration the expediency for legislation to regulate practice of pharmacy in the State; the committee on water supply and drainage, to prevent pollution of Blackstone river by sewage of city of Worcester. Also to prevent pollution of streams of the Commonwealth by sewage from municipal systems of sewerage and other sources, and waste of manufactures.

On the 9th ult., three cases of food adulteration were settled in the Court of Special Sessions. S. Steiermann, C. Sinnigen and P. Greifenstein were charged with selling mustard adulterated with flour. In each case the defendant pleaded guilty and was fined $10.

Prof. C. F. Chandler of this city read a paper to the New York farmers at Delmonico's, last week, on butter.

The Connecticut Pharmaceutical Association met in Waterbury Feb. 6th and 7th.

The test of the capacity of a fool's stomach, which has been creating such an excitement in certain circles in New York, has stimulated some Philadelphians to a task even more difficult. A wager has been made between two sporting men that a man could be produced by one of them who would drink a quart of Schuylkill water within ten minutes, every day for six days.

Gov. Ireland, of Texas, has advised in a message to the Legislature that vaccination be made compulsory in that State. "I am, as a rule," he says, "very thoroughly opposed to paternal governments, but on this subject I am as firmly fixed.—*N. O. Picayune.*

By a typographical error, the table given in THE SANITARY ENGINEER of last week, page 277, was headed as being for the week ending February 3 instead of February 10, as it should have been.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

For the week ending February 17, of an urban population of 6,947,595, there died 2,980, which is equivalent to an annual death rate of 21.8 per 1,000, or the same rate as that for the month of January.

For the North Atlantic cities the death rate was 20.3; for the Eastern cities 22.9; for the lake cities 19.2; for the river cities 21.8; and in the Southern cities for whites 23.4, and for the colored 34.9 per 1,000.

Cincinnati reports a mortality rate of 28.1, as against 23.1 the preceding week, the increase being due to accidents, scarlet fever and diseases of the lungs. Deaths from small-pox are reported, in Philadelphia two, Wilmington ten, Chicago three, Pittsburgh one, Minneapolis two, Nashville one, and New Orleans 21.

The mortality rate in our larger cities continues less than in those of Great Britain or Germany.

BOSTON, MASS.—C. E. Davis. Jr., reports 30 cases of diphtheria, 17 of scarlet fever and three of typhoid fever.

DETROIT, MICH.—Dr. O. W. Wight reports 20 cases of diphtheria and 12 of scarlet fever.

MILWAUKEE, WIS.—Dr. E. W. Diercks reports 12 new cases of scarlet fever and seven of diphtheria.

WHEELING, W. VA.—Dr. Edward reports two new cases of small-pox.

PITTSBURGH, PA.—Dr. W. Snively reports four new cases of small-pox.

NEW YORK CITY.—The tabulated death from small-pox is reported by Dr. John T. Nagle as having been derived from the S. S. "Elbe" from Bremen.

NEW YORK CITY LUNATIC ASYLUM.—Dr. T. M. Franklin reports ten admissions, three discharges, no deaths and 1,332 insane patients remaining under treatment.

NEW HAVEN, CONN.—Dr. J. J. S. Doherty reports the population of the city as 73,000, according to the school census of the past year.

SANDWICH, ILL.—Dr. N. E. Ballou, in reporting a death from scarlet fever, during the week ending Feb. 17, states that the disease is very prevalent.

Digitized by Google

PROVIDENCE, R. I.—Dr. E. M. Snow, in commenting upon the fact that there were only 31 deaths in the city during the week ending Feb. 10 as compared with 56 during the previous week says: The extremely small number of deaths last week, no more than the large number the week before, does not indicate any sudden change in the public health. There is more sickness in the city than the average for the season; but the gradual disappearance of typhoid fever, and the small number of deaths from diphtheria and other zymotic diseases are favorable indications of an improvement.

For a more striking illustration of weekly variation see below, Camden, N. J., weeks ending Feb. 3 and 10.

PATERSON, N. J.—Dr. W. K. Newton, in transmitting report for the week ending Feb. 17, states that the population in 1880 was 50,887, but that it has increased since then to 57,000. Our calculation based on the increase during the decimal period 1870–80 gives the city a population of 58,324 on March 1, 1883, the middle of the sixth half year from the date of the last census.

BALTIMORE, MD.—The report for the week ending Feb. 17 shows the occurrence of 204 deaths; males 118, females 86; under five years 84, over 60 years 23. The annual rate, based upon the population as estimated by the local authorities, is reported as, whole population 25.93, white 23.98, colored 37.26. Small-pox caused 51 deaths, consumption 28, bronchitis six, congestion of lungs three, pneumonia ten, typhoid fever two, malarial fever one, scarlet fever seven, puerperal fever three, diphtheria 15, croup three, and accident one. No deaths are recorded from whooping cough, measles or diarrhœa.

LAZERNE, WARREN CO., N. Y.—At a meeting of the Board of Health held Jan. 30, rules and regulations were adopted looking to the improvement of the general sanitary condition, the prevention and regulation of contagious diseases, the registration of vital statistics, and the issuance of burial permits.

FORT WORTH, LARRANT CO., TEXAS.—Belle M. Burchill, P. M., reports under date Feb. 13, that small-pox has occurred with some violence in the city. During the week ending Feb. 10 there were seven deaths from this disease and 12 new cases reported.

MICHIGAN.—Dr. H. B. Baker's report for the week ending Feb. 10 shows the following diseases in their order of prevalence: neuralgia, bronchitis, rheumatism, consumption, intermittent fever, tonsilitis, influenza and pneumonia. Diphtheria and scarlet fever were each reported at 19 places and measles at 16 places. Small-pox at St. Joseph, Berrien Co., was reported as having ceased Feb. 10.

DAYTON, OHIO.—Dr. E. B. Davis reports 10 deaths from all causes during the week ending Feb. 10; of these three occurred in persons under five years of age. One death was caused by consumption, one by malarial and two by puerperal fevers. Two cases of small-pox were reported Feb. 10 as being present in the city.

SAVANNAH, GA.—Dr. J. F. McFarland reports for the week ending Feb. 10 a total of 20 deaths: whites eight, colored 12; under five years not stated. Two of the whites are reported as having died of cerebro-spinal meningitis. One of the colored died of consumption and four of pneumonia.

CAMDEN, N. J.—Dr. H. F. Palm sends reports for the weeks ending Jan. 27 and Feb. 3 and 10.

Jan. 27: total mortality 11, under five years four; accident, consumption, scarlet fever, pneumonia and acute bronchitis caused one death each.

Feb. 3: total mortality six, under five years one: typhoid fever caused one death.

Feb. 10: total mortality 26, under five years five; consumption caused five deaths, diphtheria one, typhoid fever two, pneumonia three and bronchitis one.

NEWARK, N. J.—The Annual Report for 1882 shows a total mortality of 3,921; men 898, boys 1,176, women 776, girls 1,071; under five years, 1,840, over 60 years, 590. Bronchitis caused 197 deaths, diarrhœal diseases 194, malarial fevers 55, scarlet fever 199, typhoid fever 57, typhus fever four, puerperal fever eight, diphtheria 126, croup 94, pneumonia 299, small-pox 14, whooping cough 31, consumption 477, and violence 86.

MACON, GA.—The First Annual Report of the Board of Health of this city gives the mortality statistics from March 1, 1882, the date at which the first reports were made, to Dec. 31. Total mortality 240, including eight deaths by accidental causes. Deaths by disease 232; white males 46, females 57; colored males 54, females 75. Annual rate for the whole population, 16.36; for the whites 13.77, for the colored 19.37. Bronchitis caused two deaths, diarrhœal diseases nine, malarial fever 18, typhoid fever five, scarlet fever one, puerperal fever one, croup four, diphtheria one, consumption 35, and pneumonia 12. The cause of death in 38 cases is reported as unknown.

CONCORD, N. H.—The report for the year 1882 gives the total deaths as 216; population 14,000, rate 15.44. Croup and diphtheria caused seven deaths, erysipelas one, typhoid fever eight, cerebro-spinal meningitis one, whooping cough three, diarrhœal diseases eight, consumption 38, bronchitis three, congestion of lungs three, pneumonia 14, and violence four. Forty-two of the deaths occurred in children under five years of age, and 56 in persons over 70 years. The number of births in 1882 was 272, not including 18 still-births; males 130, females 142.

RICHMOND, VA.—Dr. J. G. Cabell transmits a summary of the deaths which occurred during the year 1882. For comparison the figures of 1881 are given in brackets: Estimated population 68,000 (66,000). Total deaths, 1,853 (2,049); whites 792 (865), colored 1,061 (1,184.) Annual rate, whites 19.80 (22.29); colored 37.89 (43.19). Still-births 147 (161). Croup 12 (12), diarrhœal diseases 179 (195), cerebro-spinal meninigitis 17 (eight), diphtheria 17 (16), erysipelas five (six), congestive fever eight (four), measles three (14), puerperal fever eight (ten), remittant fever five (four), scarlet fever eight (unknown), small-pox 96 (150), typhoid fever 52 (72), whooping cough 12 (35), consumption 247 (281), bronchitis 18 (23), pneumonia 103 (83), and violence 72 (69).

SANTIAGO DE CUBA.—Consul Jno. C. Landreau reports for the month of January a total of 83 deaths in a population of 40,000. Six cases of yellow fever are reported and six deaths from that disease, but the harbor and its vicinity continue free from the infection.

DEMERARA, BRITISH GUIANA.—Consul Philip Figgelmesy transmits the reports for the month of December, from Georgetown and New Amsterdam.

In the former city there were 168 deaths and 132 births, in a population of 47,175. Of the 168 deaths 86 occurred in hospital and other public institutions; 31 were infants under one year of age, and 51 of persons of one year and upwards, occurring in the city. Croup caused one death, malarial fevers five, diarrhœa and dysentery 19, leprosy five, consumption 37, tetanus six, pleurisy one, pneumonia two, and violence two.

In the several divisions of New Amsterdam, containing a population of 8,124, there occurred 39 births and 54 deaths. Of the deaths, 38 took place in hospitals and other institution; six were under one year and 10 occurred among persons of one year and upwards in the town. Diarrhœa caused two deaths, remittent fever one, consumption three, tetanus one, bronchitis and pneumonia four, and violence four.

GUAYAQUIL, ECUADOR.—Vice-Consul A. Destruge sends the mortality report for 1882. Total number of deaths 2,143, of which 938 were caused by "fevers," 296 by yellow fever, 207 by consumption, 130 by pneumonia, 73 by dysentery, nine by small-pox, 45 by diarrhœa, and 10 by tetanus. In the year 1880 there were 3,096 deaths, in 1881 2,244 deaths, and in 1882 2,143 deaths. Population not stated on the report.

ENGLAND.—Deputy-Consul General L. H. Mitchell sends the returns of the registrar-general for the weeks ending Jan. 27 and Feb. 3.

During the former week the average mortality in the 28 great towns of England and Wales was 22.4 per 1,000, Brighton giving the lowest rate, 12.7, and Liverpool the highest, 31.1. During the latter the average rate was 23.7, Portsmouth giving the lowest, 17.9, and Sunderland the highest, 35.3.

LONDON.—During the week ending Jan. 27, 2,670 births and 1,548 deaths were registered; the former were 149 and the latter 50, many as 347 below the average numbers in the corresponding weeks of the past 10 years. The annual mortality rate was 20.4. The 1,548 deaths included eight from small-pox, 33 from measles, 40 from scarlet fever, 24 from diphtheria, 37 from whooping cough, two from typhus, 17 from typhoid fever, 13 from diarrhœa and dysentery. The deaths from these zymotic diseases were 78 below the corrected average number.

During the week ending Feb. 3 there were 2,750 births and 1,643 deaths, the former being 96 and the latter 369 below the average. Annual rate 21.7. Small-pox caused five deaths, measles 28, scarlet fever 45, diphtheria 20, whooping cough 35, typhus three, typhoid 15, and diarrhœa and dysentery 19. The deaths from zymotic diseases were, as during the previous week, 78 below the corrected average.

SCOTLAND.—Consul J. A. Leonard transmits returns of registrar-general for week ending February 3. The mean death-rate in the eight principal towns was 26.3 or 5.2 above that for the corresponding week of last year. The lowest mortality was recorded in Edinburgh, viz., 19.2, and the highest in Greenock, viz., 32.0 per 1,000. The deaths from acute diseases of the chest decreased slightly. For summary see table above.

IRELAND.—Consul A. B. Wood transmits a copy of the registrar-general's return of deaths in the 16 principal urban districts for the week ending January 27. An abstract of the data contained in it is given in our table above.

BELFAST.—Total mortality 116. Annual rate 28.2. Measles, typhus fever and violence caused one death each, scarlet fever three, whooping cough five, consumption 18 and diseases of the respiratory system 40.

PARIS, FRANCE.—The bulletin for the week ending February 1 shows a total of 1,149 deaths; males 662, females 487; under five years 346, over 60 years 256. Annual rate 26.66. Typhoid fever caused 45 deaths, small-pox 15, measles 17, scarlet fever three, whooping cough eight, diphtheria and croup 38, erysipelas three, puerperal infection none, consumption 239, acute bronchitis 33, pneumonia 95 and violence 24. On January 28 there remained under treatment in the hospitals 67 cases of small-pox, 538 of typhoid fever and 35 of diphtheria. The births during the week numbered 1,253.

The epidemic of typhoid fever seems to be undoubtedly at an end. It began about the 4th of August, 1882, and since then has numbered at least 2,437 victims. "The facts connected with this epidemic show that the violence of epidemic diseases can be mitigated only by hygienic means, *i.e.*, for diseases treated at home, the employment of disinfectants, and for those not thus cared for, their transportation to extra-mural hospitals."

RHEIMS, FRANCE.—Consul Jno. L. Frisbie transmits reports for the week ending January 27 giving a total of 49 deaths, caused chiefly by lung diseases rendered prevalent and fatal by the continuance of damp weather variable as to temperature.

STOCKHOLM, SWEDEN.—Consul Elfwing transmits report for week ending January 20 showing the occurrence of 91 deaths; males 39, females 52; under five years 38, over 60 years 20. No deaths are recorded from small-pox, measles, whooping cough or violence. Scarlet fever caused six deaths, puerperal and typhoid fevers one each, diphtheria and croup nine, diarrhœa two, consumption 11, pneumonia 15 and bronchitis 14.

During the week ending January 27 there were reported 60 cases of measles, none of small-pox, 26 of scarlet fever, 13 of whooping cough, ten of diphtheria, five of typhoid fever, 36 of diarrhœa, 20 of tonsilitis, 17 of pneumonia and 133 of bronchitis.

FIRST ANNUAL REPORT OF THE STATE BOARD OF HEALTH OF THE STATE OF NEW HAMPSHIRE, for the Fiscal Year ending April 30, 1882, with the Registration Report 1881. Concord, 1882. 318 pp. 8vo.

The State Board of Health of New Hampshire was organized in September, 1881. One of its first acts was to issue a circular of warning with regard to small-pox, calling attention to the law providing that all children must show satisfactory evidence that they have been properly vaccinated before entering school. The Board considers that its efforts to secure vaccination throughout the State were very successful, and believe "that New Hampshire was never so well protected against small-pox as at the present time. Bovine virus was almost exclusively employed. The paper of Prof. C. A. Lindsley, of Yale College, upon vaccination, published in the last report of the Connecticut State Board of Health, is reprinted in this report, and properly endorsed as containing many valuable facts and suggestions. We are very glad to see this as an evidence that the Board is prepared to make use of good work wherever it finds it. The report contains papers by Dr. G. P. Conn on ventilation, and Mr. W. R. Briggs on school buildings, which have already been noticed in the SANITARY ENGINEER. The paper on adulteration of food, by Dr. E. J. Bartlett, of Hanover, gives a brief sketch of existing legislation on the subject, and properly takes the ground that "the grinning death's head of the skeleton that sits in the pot is too sensational a picture for to-day. Now, a mighty dollar, with a shrewd wink upon the eye of the glorious fowl, would be a much more suitable devise for a treatise upon food adulteration. It is honesty, not existence—for the most part money, not health—that is at stake." The statistics given, which seem to be fairly and accurately compiled, show that of 6,225 samples of food examined in recent years in the United States and Canada, 2,830 or 45.24 per cent. were adulterated. The report closes with the remark that "such restrictions as will secure honest trade are surely for the advantage of all honest men."

Dr. Irving A. Watson, the Secretary of the Board, contributes a useful compilation of "Common Law Citations relating to Nuisances," and Dr. A. H. Crosby furnishes a brief but suggestive paper on "Water Pollution, Public and Private."

The registration report is presented with the remark that the present law is defective and will not secure correct returns. The figures given indicate a birth rate of 13.30, and a death rate of 13.40 per 1000 of living population, but these are evidently much too low.

In an appendix are given the laws of the State relating to public health, and the registration of vital statistics.

We congratulate the Board upon this its first report. It is a common sense, business-like document, avoiding sensational appeals, and we hope it is the first of a long series of instructive and useful health and registration reports.

SCARLET FEVER IN VIRGINIA.

The Wytheville *Dispatch* says that the extent to which the scarlet fever is spreading throughout the Valley of Virginia is appalling. About a month ago it broke out near Staunton, and has since reached that city, and spread to such an extent that many of the schools have been forced to close.

The report of Dr. McCann, the Examining Physician of the Bureau for the Medical and Surgical Relief of the out-door poor in New York City, shows that during the month of January 2,142 applicants were admitted to hospitals; 867 going to Bellevue, 593 to Charity Hospital and 555 to the Homœopathic Hospital. Of these, 35 were cases of fever, 192 general diseases, 270 diseases of the nervous system, 366 diseases of the respiratory organs, 151 due to alcohol, and 445 were surgical cases.

The Fall River Board of Health finds fault with the Watuppa Reservoir Company for allowing poisonous vapors to arise from the pond during low water in summer, and suggests a petition to the Legislature to compel the company to abate the nuisance.

The State Board of Health of Wisconsin at a meeting at Madison, Jan. 31, adopted resolutions requesting Congres to remove the restrictions placed on the National Board of Health and give them sufficient means to carry on the work hitherto committed to them.

MEMPHIS SYSTEM OF SEWERAGE IN PARIS.

In 1881 an order was given by the Municipal authorities of Paris for the assignment of a district in the interior of Paris for trial on a larger scale of Waring's system of sewerage, including a modification of the house drainage substantially according to the method adopted in Memphis. Plans were made and estimates were prepared. Nothing further was done.

The subject of "The Odors of Paris" having excited much attention for several years, and the very serious epidemics of typhoid fever in different parts of the city in 1882, led to the formation of a Municipal Commission of forty members for the investigation of the whole subject. From this there were constituted sub-commissions, to one of which the subject of sewerage was referred, it being a definite part of its duty to examine into the merits of the systems of Lieunier, Berlier and Waring. Col. Waring appeared before this commission in November accompanied by Mr. Ernest Poutzen, C.E., who is the European consulting engineer of the Drainage Construction Co., owning the Waring patents. Mr. Poutzen was called before the Commission again Jan. 10, '83. As a result of the discussion then held, an order has been given for the immediate constuction of about three or four kilometers of sewers and the complete redrainage of about 100 houses adjoining, the population reaching to from 7,000 to 10,000. The work is to be executed by the Drainage Construction Co. under a contract with the city, the city paying for the sewers, flush tanks, etc., and the re-arrangement of house drainage being at the cost of the proprietors, in consideration of a remission for five years of the heavy sewer tax now imposed. This remission will be ample to cover the cost of the modification.

Owing to the rapid growth of the population there are very large districts of Paris which have no sewers whatever, and these have been the chief seats of the typhoid epidemics. If this experimental piece of work proves satisfactory to the authorities, it is hoped the system will be extended.

THE NEED OF SEWERS AT CINCINNATI.

[From our Special Correspondent.]

A completed sewer system would prove of infinite value to Cincinnati and her low suburbs at this time. The submerged district extends for about three miles along the river front. Within the city proper, for about a mile in extent, the waters have covered Water, Front and Second streets, and lapped upon Pearl street, the fourth from the river. In the western portion the flood reached Fifth street and covered all the streets in Mill creek bottom from the river northward, including Cummingsville. Several square miles of houses, therefore, have been inundated. Had the sewerage system been perfect the thousands of full cellars and vaults would have been drained as the river crept back into its channel. Unfortunately, however, say one-half of the flooded district is without sewerage of any kind, and the dwellings and business houses sit over a small lake of water, which must either be pumped out by individual owners or be allowed the time necessary to evaporate and filter through the soil. The expense or the tedious waiting for the water to pass away is of small moment compared with the outlook from a sanitary point of view. Do what they may, before midsummer the unsewered district will not be dry again. And what of disease and death lurks in those undrained cellars and vaults when the warm sun shall give it wings is a matter for serious consideration, and one which concerns the whole city. The fear of an epidemic to follow the flood is increased by the deplorable condition of our streets, and the want of an efficient sanitary department. Neither the street cleaning nor sanitary department, especially the former, have had sufficient money at their disposal to keep up the thoroughfares or maintain a good sanitary condition otherwise, and thousands are looking fearfully forward to the approaching summer as a most favorable season to reap the fruits of incompetentcy and parsimony. The whole city government seems on the eve of being revolutionized, and the opposing party are struggling for supremacy in the coming adjustment. One bill is pending to abolish the Board of Health and have a commissioner appointed with powers. Another faction will introduce a bill to virtually abolish the Board of Public Works and Health Board, and give the powers of both into the hands of five commissioners together with a million of dollars to be expended in two years. Save that the Board of Health lost its reputation, if it has ever had one, there has been just one thing wanting for several years and that is the million dollars, or perhaps better two millions, to be expended in sewerage, street repairs and other sanitary improvements.

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

Pure Sugar
vs.
Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

HAVEMEYERS & ELDER.
DECASTRO & DONNER REFINING CO.

117 WALL STREET,
NEW YORK.

Reliable Food Products.

As the Largest Manufacturers and Dealers in the world in this line, we prefer, and, indeed, we consider it to our interest to manufacture only PURE and WHOLESOME goods, and pack them in a tidy and attractive manner. *All goods bearing our name are guaranteed to be of superior quality, and dealers are authorized to refund the purchase price in any case where consumers have cause for dissatisfaction.* It is, therefore, to the interest of both dealers and consumers to use THURBERS' BRANDS.

H. K. & F. B. THURBER & CO.

West Broadway, Reade and Hudson Streets, New York.
9 and 11 Fenchurch Avenue, London. E. C., England.
9 Rue Foy, Bordeaux, France.

NOTICE.

Our Canned Goods are put up with a special quality of tin, and most of them, being hermetically sealed while fresh at the sources of supply, preserve the fresh, natural flavors, and are REALLY FRESHER, MORE WHOLESOME AND PALATABLE than many so called "fresh" articles which are exposed for sale during considerable periods of time in city markets.

Proposals.

PROPOSALS FOR IRON STAIRS, ETC., AT TOPEKA, KANSAS.

OFFICE OF SUPERVISING ARCHITECT,
TREASURY DEPARTMENT,
WASHINGTON, D. C., *Feb.* 23, 1883.

Sealed proposals will be received at this office until 12 M., on the 14th day of March, 1883, for furnishing and fixing in place complete, the Iron Stairs, etc, required for the Court House and Post Office building, at *Topeka, Kansas*, in accordance with drawings and specification, copies of which and any additional information may be had on application at this office or the office of the Superintendent.
JAS. G. HILL, *Supervising Architect.*

PROPOSALS FOR BUILDING A STEAM PROPELLER FOR THE QUARTERMASTER'S DEPARTMENT.

DEPOT QUARTERMASTER'S OFFICE,
CORNER HOUSTON AND GREENE STS.,
NEW YORK CITY, *Feb.* 5, 1883.

Sealed proposals, in triplicate, with a copy of this advertisement attached to each, are invited, and will be received at this office until 12 M., March 7, 1883, at which time they will be opened in the presence of bidders, for the construction of a steam propeller for the United States Quartermaster's Department, for service at Fort Monroe, Virginia. Bids are invited to be made for the vessel complete; also for that portion embraced in specifications No. 1, or that in No. 2, or that in No. 3, only, or those portions in any two of them. Plans and specifications of the same, together with all other necessary information, will be furnished to bidders on application to the Chief Quartermaster on Governor's Island, New York Harbor, the Depot Quartermasters at Washington, Baltimore, Philadelphia and Boston, the Post Quartermaster at Fort Monroe, Virginia, and at this office. Bids are also invited for the work on the basis of supplying out-board condenser, 6-inch, No. 8 copper, or ¼ brass. Also on the basis of the Government supplying the circulating and air pump, and a condenser of one-half the required capacity, the contractor furnishing the other half and making all connections. In either case, if award is made thereon, the specifiations will be changed accordingly. The right is reserved, on the part of the United States, to reject any or all bids. Proposals should be endorsed "Proposals for Construction of Steam Propeller," and addressed to the undersigned.
HENRY C. HODGES,
Deputy Quartermaster-General, United States Army.

Caloric Pumping Engine

is especially intended for domestic use in lifting and forcing water from wells and cisterns, or from Croton pipes, to tanks on upper floors of buildings in city or country.

This pumping engine is entirely safe, no steam being employed, and is not liable to derangement.

All kinds of fuel will answer for this engine, but coal-gas is preferable, the consumption being only 15 cubic feet per hour. Besides, gas is handier and cleaner than coal or other combustibles. Servant girl can operate it.

Price for 6-inch cylinder, pumping 200 gallons per hour 50 feet: With gas furnace, $210. With coal furnace, $220
Price for 8-inch cylinder, pumping 350 gallons per hour 50 feet: With gas furnace, $260. With coal furnace, $275
Price for 12-inch cylinder, pumping 800-gallons per hour 50 feet: With coal furnace only.....$375
Price for duplex 12-inch cylinders, pumping 1,600 gallons per hour 50 feet; with coal furnace only.....$550

Agents for the Joel Hayden Brass Works, Lorain, O.

The "EUREKA" Wheel Pipe-Cutter.

☞ If the House of whom you purchase your supplies does not keep it, send direct to us.

The Body—is fitted with an adjustable Cast-Steel Jaw at the point where it comes in contact with the Pipe, which Jaw can be renewed at any time by simply removing one screw. By this system the wearing away of the Jaw (which is other cutters is the first part to give out) is effectually prevented, and this tool can be kept in first-class order at all times.
The Wheel Block—This is also of Cast-Steel, neatly fitted to its socket *and cannot be dropped out.* It is much more durable than the cast-iron blocks and is hardened at the point where the rod comes in contact with it.
The Handle—of this Cutter *is put on to stay*, and cannot be removed by the roughest usage, as it is a hollow iron handle, *cast fast to the Rod*, operating the block.
Manufactured by PANCOAST & MAULE, 243 and 245 South Third Street, PHILADELPHIA, PA.

JENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

"THE DU BOIS" TRAPS.

These Celebrated Traps are made in the same way as lead pipe—Sound and Smooth, Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

The "National" Patent Side Outlet Closet and Trap.

WITH IMPROVED FLUSH. (Registered).

Made either complete in one piece of Earthenware, or in two pieces with Basin and Trap separate

An important alteration has been made in the *flushing* arrangement of this closet. The *supply* is now placed *opposite* the *outlet*, and a *new registered fan* attached which makes the closet more effective, and with less than two gallons of water it is guaranteed to perfectly flush out the soil and thoroughly wash the inside of basin.

The Most Cleanly, Durable, Effective and Cheapest Closet and Trap ever used, requires no fittings nor Machinery of any kind, and cannot get out of order.

For the perfect working of this closet a supply pipe not less than 1¼ inch must be used.

MANUFACTURED BY THOS. TWYFORD, HANLEY, STAFFORDSHIRE, ENG.

Sole Agent for the Manufacturer, E. ASPINALL, 206 Pearl Street, New York.

PLUMBERS' AND SANITARY EARTHENWARE OF ALL DESCRIPTIONS.

Illustrated Catalogue and Prices Furnished the Trade on Application.

SECTIONAL VIEW OF VALVE.

BENNOR

Syphon Trap

Will recommend itself to *Architects, Plumbers and Sanitary Engineers.*

Because: *First*—It is a perfect seal under all circumstances, with or without water.

Second—By the peculiar construction of the valve in connection with its syphoning force, the trap and adjoining pipes are kept clean and free of coating.

Third—It cannot become clogged.

Fourth—It is simple, durable, cheap and easily adjusted.

BENNOR SYPHON TRAP CO., LIMITED.

17 North 9th St., Philadelphia, Pa.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

Address,

THE SANITARY ENGINEER,

P. O. 3037. 140 William Street, N. Y

TWO years ago the undersigned introduced to the trade in this country THE ROYAL PORCELAIN BATH.

Prior to that period it was little known, except to those Americans who may have seen them when traveling in Great Britain; while it is true that they had been used there for 25 years, and were universally conceded to be the finest thing in the way of a Bath Tub known, yet, like all things supposed to be new and of high cost, they required extensive advertising to secure their acceptance and use to any considerable extent in the United States.

The effect of numerous expressions of opinion, made without either knowledge or experience to justify them as to their durability and utility, had to be counteracted, yet, as a result, we have succeeded in having them selected for some of the most elegant residences that have been erected within the past ten years. They have also been used in several hospitals, for which places we make a special, less elaborate, and cheaper class of fittings.

A personal inspection will convince any one of their superiority. Their increased cost over that of an ordinary copper-lined bath tub should not be a consideration to those who can afford to live in a house worth over $15,000, and would not be if their cleanliness, inviting appearance and durability was appreciated.

MEYER, SNIFFEN & CO.

46 & 48 Cliff Street,
New York.

N. B.—We have imported a line of sinks, which are made of the same non-absorbent material as the ROYAL PORCELAIN BATH TUBS. They are admirable for Hospitals. They have been used in some of our elegant New York residences, where their expense was no objection. They are one and one-half inches thick, and are less likely to be broken than cast iron. We have a size in stock that would make an admirable "Foot Bath."

Digitized by Google

THE BRIGHTON.

There is a tendency in some quarters to demand a Hopper form of Water Closet and to dispense with what are called mechanical parts. This would be desirable, if the so-called mechanical parts did not secure advantages in the matter of a large body of water in the bowl, not otherwise obtainable, without resorting to methods not everywhere applicable or sufficiently demonstrated as practicable.

The Brighton Closet here illustrated is, we believe, the best compromise yet devised between the Hellyer form on the one hand and the Hopper on the other.

By examining the sectional cut, it will be seen that the bottom of the bowl is covered with water, while the flush and shape of the bowl is such that the trunk on the back is kept clean.

It is attractive in appearance, being all in one piece, of white earthenware.

The pipe *B*, connected with the trunk, can be run into a heated flue when desired.

These Closets have had a large sale in England during the past four years. We have had them in use in our factory nearly two years—and we now offer them to those who prefer a different form of Water Closet than the *Hellyer, which, by the way, does not, in a single instance, so far as we know, fail to satisfy those who have them in use.*

This will be known as

"Meyer, Sniffen & Co.'s Water Closet Apparatus No. 30."

Persons interested are invited to call at our warerooms, Nos. 46 and 48 Cliff Street, New York, or at No. 1 Pemberton Square, Boston, and examine this and other specialties that we have fitted up with water attached, including THE ROYAL PORCELAIN BATH, THE MODEL PORCELAIN SLOP HOPPER, THE HELLYER CLOSET AND HOPPER, THE RHOADS HOPPER, DOHERTY SELF-CLOSING COCKS, FULLER FAUCETS, etc.

MEYER, SNIFFEN & CO.

BOYLE'S PATENT

Tidal Wave

WATER CLOSET.

Patented in all principal countries.

SECTIONAL VIEW.

A—Air Pipe. C—Supply Pipe.
B—Flush Pipe. D—Vent.
E—Connection for Fresh Air Pipe.

A New Departure in Water Closets.

The closet is made of one piece of earthenware, and supplied with Waste-Preventing Cistern coming under the lowest rate of taxation, as adopted by the Department of Public Works of New York.

Wherever in use, the closet has given entire satisfaction, and is recommended by leading authorities on sanitary matters as coming up to the requirements of a first-class appliance of its kind, being

Simple and Positive in Operation, Clean in Use and Perfect in a Sanitary point of view.

Write for Descriptive Circulars.

Further attention is called to

BOYLE'S PATENT

Universal Waste Preventing Cistern

AND

COMBINATION LEVER.

DISPENSING WITH SERVICE BOX.

The Cistern Valve insures both a copious preliminary and after-flush for either Hopper or Cistern Closet, the importance of which is well understood by every plumber. The flush can be regulated from one to four gallons.

NEW YORK, MARCH 8, 1883.

SINGLE COPIES 7 CENTS.
Price of Single Copies more than one week old dependent on number on hand.

Entered at the Post Office at New York, N. Y., as second-class matter.

THE SANITARY ENGINEER, *conducted by* HENRY C. MEYER, *is published every Thursday, at* 140 *William Street, New York. Its opinions upon all technical subjects are either prepared or revised by specialists.*

TERMS, $3 PER YEAR, IN ADVANCE.

Postage Paid.

OFFICE IN GREAT BRITAIN: 16 CHARING CROSS, LONDON.

E. & F. N. SPON, Agents.

TERMS 16*s.* 6*d.*, PER YEAR, IN ADVANCE. *Postage Paid.*

CONTINENTAL SUBSCRIPTIONS RECEIVED BY

F. A. BROCKHAUS, Esq., Querstrasse 29, Leipzig, Germany.

Subscriptions to the Continent of Europe and Australia, $4; China, Japan, Sandwich Islands, Mexico and Cuba, $4; South America, $5.

NOTE.

Persons in any of these countries can send us the subscription price, by calling at their Post Office and leaving with the official the equivalent in their own money, for which he will give them what is called a "Post Office Order," which, if enclosed to us will be paid by our Post Office, the same as a draft when presented by us.

Fractional parts of a dollar may be sent in postage stamps.

Subscribers will please notify us of any failure to receive the paper, and also of any change in their address.

For Advertising Rates see last page.

Entered according to Act of Congress in the year 1880, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

TABLE OF CONTENTS.

ADVERTISEMENTS..... 327-336

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

British Subscribers who wish to receive this paper, without interruption should renew their subscriptions a month before expiration, with Messrs. E. & F. N. Spon, London, in order that they may be able to notify the Publisher, in New York, of the fact.

NOTICE.—Correspondents will prevent needless delays and annoyance if they will address all communications, except those of a strictly private nature, to THE SANITARY ENGINEER. Checks should also be drawn to the same order.

INUNDATIONS AND THE PUBLIC HEALTH.

Our readers are, no doubt, familiar with the descriptions of the recent overflows in the valley of the Ohio River, and have noted with satisfaction the despatches which announced the turn of the tide and recorded the inches of hourly fall as they had previously done for the rise.

The destruction of property has been considerable, there has been some loss of life and serious interruptions to business, and now the question comes up, what is to be the effect of this on the health of the inhabitants of the inundated districts? No doubt there will be a certain amount of disease directly produced by exposure and privation during the inundation; but is there anything to fear from the mud and *débris* which is left on the subsidence of the flood? There is very little definite information to be gained from the experience of previous floods of a like character in the Mississippi valley, since this experience has not been recorded; but so far as we know, there is no reason for serious apprehension as to the public health merely from the presence of this mud and *débris* at this time of the year. Two years ago Dr. Chaillé, of New Orleans, endeavored to collect information as to the effect which inundations in the lower Mississippi valley had produced on the health of the localities affected, more especially with reference to yellow fever and the malarial fevers, but he was unable to find indications that there was any special increase of these diseases after such floods, indeed, the evidence seemed rather to point in the opposite direction.

It must be remembered that the dirt that is left by the retiring waters is for the most part composed of particles of alluvial soil, that a very considerable amount of really dangerous and decomposing organic matter is either swept away by the torrent in which it is rapidly oxydised and decomposed, or covered by fresh earth, which is not a bad disinfectant; and, also, that the deposit compels a general cleansing in which much filth is got rid of that was not brought down by the river, and which might otherwise have remained in the cellars, yards and alleys for an indefinite period.

With the exercise of a little energy, therefore, there is every reason to believe that all danger to health from filth deposited by the flood can be removed.

At the same time, it will be well for the citizens of Cincinnati, Louisville, and other inundated communities to remember the "the gods help those who help themselves," and to organize their sanitary work in a proper manner while there is yet time.

THE MEDICAL AND SANITARY DEPARTMENTS OF OCEAN STEAMSHIPS.

English medical journals have recently discussed the above subject from the English point of view, and the prevailing opinion seems to be that it is time that Government took some steps to regulate the Merchant Marine Medical Service. But, however interesting this matter may be to our English brethren, it is much more so to us, for the Atlantic steamers are becoming a most important element in our national life. This is true not only as regards immigrants, of the thousands of whom that annually land on our shores an undue proportion have their health injured during the voyage, but also as regards that large and increasing class of our leading professional and business men with their families, who seek health, rest and pleasure in a summer trip to Europe. Thus far the effort of civil steamship companies seem to have been mainly directed to securing safety, speed and conveniences of the average hotel, and we may presume that the demands on the part of the public for them are those which have been found most imperative. The time is close at hand, however, when it will pay to introduce the latest improvements in sanitary mechanism; to provide effective systems of fan ventilation combined with a proper method of heating, in place of the old fashioned bell-mouth wind tubes, which are generally useless in rough weather when they are most needed; to furnish comfortable water closets which shall be free from the foul odors which, far too frequently, make such institutions a nuisance on board ship; and to provide for skilled and careful sanitary supervision of the whole vessel.

The editor of the *British Medical Journal* remarks that upon Atlantic steamers "hygienic requirements are left pretty much to hap-hazard, or certainly made subservient to all other considerations. The medical officers' sanitary responsibilities are wholly undefined. Each ship has a varying custom, dependent apparently upon the combined opinions of the owners, captain, purser and steward. The surgeon is given to understand that neither captain nor owners require any suggestion from him, and that a policy of non-interference will be the most consistant with his own comfort.

"About fifty dollars per month is the highest salary he can expect. His object therefore is to make as much as possible out of the passengers, and the more sickness there is among them during the voyage the more fees he can collect."

This is all wrong. The surgeon of a great Atlantic steamship ought to be a skilled sanitarian as well as a physician and surgeon, his

Digitized by Google

selection should be made with great care, he should be held responsible for the sanitary condition of the ship, and should have the necessary authority to secure such responsibility; and he should receive a salary sufficient to secure the services of such a man, and receive no fees whatever from passengers. Let the travelling American public once understand that one of our transatlantic lines is carrying out this policy and it is safe to say that that line will have more patronage than it can manage, even if it adds five dollars to the price of its tickets. We hope that some of the owners and managers will be shrewd enough to see it.

NEW YORK'S WATER SUPPLY.

No. VII.

THE SUPPRESSION OF WASTE.

(Continued from page 290.)

We have seen that in Manchester the testing of fittings and systematic house-to-house inspection is relied on to prevent the waste of water. Liverpool, however, is a city where remarkable results have been obtained by the use of district meters in addition to the measures employed in Manchester. A full discription of the district meter system as applied and carried out in Liverpool we gave in a series of letters on pages 494, 552 and 586 of Vol. IV.

In the present article, therefore, we shall simply recall the leading facts.

Prior to 1873 Liverpool had an intermittent water supply, the daily consumption being about 29 Imperial gallons (nearly 35 U. S. gallons). When constant service was given the amount delivered ran up to 38 gallons. The then limited amount of water accessible demanded either that constant service should be abandoned and the miserable intermittent supply reverted to, or that the waste should be stopped. In this emergency Mr. G. F. Deacon, the Chief Engineer, devised a meter to be placed on the street mains in the various districts of the city, the main purpose being to indicate whether waste was occurring or not, and if so, whether in buildings or in the mains.

It will be understood, then, that the district meters were relied on to indicate where waste was occurring, and only such places were examined; in other words, the citizens of Liverpool are not subjected to house-to-house inspection, a building not being visited unless the inspectors, by the outside means referred to, ascertain that waste is going on within.

Plumbing work, however, has to be done in accordance with prescribed rules, and the standards adopted for the various kinds of plumbing fittings, together with the system of examination and testing, is not surpassed anywhere.

This is a brief outline of the situation in Liverpool, but those of our readers interested will find a very full description in the articles previously referred to, which, under the circumstances, we do not deem it necessary to repeat. A description of the details of the administration. in the testing office may, however, be interesting.

The permanent testing office force consists of seven men: one superintendent, four assistants, and two laborers. The charges for testing are: for bibbs or taps, two pence each, ball cocks three pence, water closet cisterns, six pence. Every tap is taken apart, no matter who makes it, its seat is examined, also the character of the washer, to see that a good bearing is obtained, also the threads on the caps and spindles—indeed, in all respects it is required to conform to the sample tap that the manufacturer had deposited in the office as his standard, which tap had originally received the approval of the Engineer. When new fittings are submitted for approval which deviate from the recognized articles, the custom is to have them put in use somewhere and tried for a year, the authorities taking the ground that experiments to demonstrate the value and utility of an article should be made without risk to them or to the house owner, and though sometimes a meritorious thing is held back a year, yet by this plan a number of unreliable articles are excluded from use, and wrangles with manufacturers and inventors are avoided. In 1880 the number of fittings that "passed through the testing and stamping department was 83,613, of which the testing officers stamped 71,969, the remaining 11,644 being rejected. in consequence of defects revealed by the tests applied."

Each approved fitting has two stamps, one that is readily visible and one a private mark. The latter was made necessary because dealers were caught counterfeiting the stamp. In the testing of ball cocks, they are required to close against a pressure of 130 pounds to the inch, with the ball not over five-eighths submerged; they are also placed upside down, held shut and subjected to three hundred pounds pressure, to ascertain if the casting is perfect. To save the time of immersing each ball, the resistance in weight is estimated and the submerging test is dispensed with.

They have a scale of weight of the water displaced by the ball when immersed five-eighths in depth, a copy of which we were permitted to take by Mr. Davis, the superintendent, which is as follows:

Diameter of ball.	*Weight of displaced water.*
4½ inches.	18.96 ounces
5 "	25.89 "
5½ "	34.79 "
5¾ "	39 40 "
6 "	44.76 "
7 "	71.08 "
7⅞ "	83.13 "
8¼ "	115.78 "

To ascertain the necessary weight to put on the ball when it is turned upside down to resist the pressure of 130 pounds, they subtract twice the ascertained weight of the lever and ball from the figures in ounces given on the scale.

[To be Continued.]

THE CASE OF THE HOTEL BELLEVUE.

The most celebrated trial involving the sanitary condition of a building, which has yet occurred in this country, that of Mr. James Corey, of the Hotel Bellevue, at Sea Bright, New Jersey, on the charge of extortion, has terminated in the disagreement of the jury, they standing eight to four in favor of aquittal after being out twenty-six hours.

The prosecution in this case resolved itself into the two charges, first, that Mr. Corey, taking advantage of the condition of two members of families of wealthy gentlemen, who were lying sick of typhoid fever at his hotel, extorted five thousand dollars as the price of allowing them to remain in his house; second, that the disease from which the sick persous were suffering was caused by the bad sanitary condition of the hotel, for which they held Mr. Corey responsible.

The defence urged that the sum demanded was only a fair compensation for the ruin of Mr. Corey's business, due to the sickness, and for keeping his hotel open for the invalids after the rest of his guests had fled; and that the fever had not been contracted there, for the hotel was in good condition, but the persons had come to it in invalid state and had afterwards fallen sick.

The trial is interesting to our readers in the light it throws on the second of these points, the sanitary condition of a public resort. The prosecution presented testimony showing that before the hotel was opened the water supply had proved insufficient to flush the closets. Thomas Conroy, engineer of the Hotel Bellevue, testified that, by Mr. Corey's orders, he carried a pressure of steam on the engine too low to pump water up into the tanks which supplied the closets, and that much of the water used in the hotel was taken from a cistern into which leakage from scrubbing the kitchen floors made its way. This witness testified also that the pressure in the pipes of the Long Branch Water Supply Company was not sufficient at times to supply the house. He also testified that Mr. Corey sought to deceive the inspectors of the Board of Health by causing water to be pumped into the tanks on two occasions when their visits were expected, and caused the handle to be wrenched off the door of a closet in which water would not run. The defence cast suspicion on this witness' testimony, on the ground that he had received favors from one of the plaintiffs which prejudiced his evidence.

Further light was thrown on the state of the hotel by the testimony of Dr. Ezra M. Hunt, Secretary of the State Board of Health of New Jersey, who testified that there were no traps between the hotel and the cesspools, that the cesspool air might find its way into the hotel, and that the closets were not properly flushed. Dr. Mathew Field, Examiner in Lunacy, of this city, and at one time connected with the New York Board of Health, testified that he had examined the hotel and was satisfied that the conditions were such as might create typhoid. Dr. E. G. Janeway, also of this city, testified that in his judgment the fever must have originated at the hotel. Further testimony by employés was given to show the filthy appearance of the cistern from which the supply of water was at times derived.

For the defence was offered the testimony of William H. Cooper, a plumber, who stated that he had been ordered to do the plumbing work without regard to expense, and considered it as good a job as was done anywhere. Mr. James C. Bayles, of this city, testified that he could give no suggestions for improving the plumbing. Mr. Corey himself testified that the hotel was in good sanitary condition; and Dr. D. M. Forman, of Freehold, N. J., said, that in his opinion the fever was not due to the condition of the hotel. Other evidence was offered to show that no offense had been created when the cesspools had been opened for cleaning, and that the hotel was properly cleaned and cared for.

It is thus evident that the weight of testimony is decidedly to show that the Hotel Bellevue was not in safe condition—was, in fact, in so unsafe condition, as, in the opinion of several medical experts, to be sufficient to propagate typhoid fever. The important question is therefore offered by it, to what extent the courts and the juries will hold a landlord responsible for the condition of his house? The failure of the jury to agree leaves this point open, so far as this case is concerned. We hope, therefore, that at a new trial, the question of the liability of the owner and the tenant, the latter being in this case the landlord, may be defined.

The Bill introduced by Senator Adams, to establish a State Board of Health and a system of Registration of Vital Statistics for the State of Pennsylvania, was defeated in the Senate Legislature on Feb. 27. There were 22 votes in favor of the bill and 16 against it, thus failing of the majority required by the Constitution. The opposing vote was cast by 11 democrats and five republicans.

The opposition was mainly democratic, and on the ground that the Board would be a sort of commission with powers which would make it dangerous.

The result is much to be regretted. It is certainly time that the State of Pennsylvania was provided with some competent authority to enforce registration of vital statistics, collect reliable information as to preventable causes of diseases in the State, and to coöperate with other State boards of health.

The bad boy who produced a sewer gas scare by scattering limburger cheese about the house, has been rivaled by the pupils of a lady's school in this city. An examination was coming on, several of the young ladies were not prepared for it, and accordingly they put their heads together to devise a scheme for preventing its holding. One suggested that a sewer gas scare would be about the thing, and accordingly the fellow conspirators scattered limburger plentifully through the desks. The odors which resulted convinced the principal that there was something fatally wrong about the sanitary arrangements of the building, and the examination was indefinitely postponed. If the proverb be true that it is not all gold that glitters, it is equally true that it is not always sewer gas that gives out the penetrating odor.

THE VENTILATION OF A DOCTOR'S HOUSE.

The following description, from *Building News*, with the accompanying illustrations, will, we think, be of interest to our readers. It should be borne in mind, however, that the provisions for heating contemplate the climate of England, where such low temperatures as we are accustomed to do not prevail.

The general arrangements of this house are founded upon the principles laid down by Drs. Drysdale and Hayward in "Health and Comfort in House Building," 1876; the whole of the rooms being under one system of ventilation, and the warming practically effected by one heating stove in the basement. The fresh air for the whole house enters by the large area at the end of fresh-air chamber, under the ground-floor corridor; the sitting-rooms are supplied with air through the large arched openings, which will be closed only by curtains, and the fresh air for the first-floor rises up the staircase and enters the various rooms through openings in the skirtings and cornices. This general supply of fresh air is entirely under control at the primary outlet (detail No. 1), where it can be checked or increased, purified, warmed, or cooled at pleasure. It will at first pass through canvas or some additional permanent air-cleanser as found necessary. In winter, the fresh air will be warmed by passing up between close rows of hot-water pipes heated by a stove in the basement; and by this means, and an additional hot-water pipe running round the two nurseries, it is found that every part of the house can be warmed to a pleasant and even temperature. In summer the air will be cooled by passing through water-cleansers or over ice. From each room in the house an extracting flue is carried separately, and as directly as possible into a foul-air chamber in the roof; from this chamber, a large extracting or downcast shaft is carried across in the roof, down the outside of an external wall, under the kitchen floor and up behind the kitchen range. It is at this point that the motive power for the air throughout the house is supplied by the waste heat from the kitchen-fire; by the arrangement shown in detail No. 2, the foul air comes in contact with the boiler plate behind the range, and minimum velocity in the extracting flues of 200 feet per minute. The use of open fireplaces is not at all against the proper working of this system of ventilation, and in this house they have been built with smoke-flues, but are temporarily bricked up, as they will not be used at first. They may be found desirable, and even necessary, as a matter of sentiment; but the house can be warmed without them. All unnecessary projections for the settlement of dust and dirt have been avoided inside the building, the architraves of doors and windows having no projection beyond the face of wall, and the plaster cornices having very small members. The heating and ventilating arrangements have been carried out entirely at the owner's desire.

Contents of fresh air chamber	1,530	cubic feet.
Length of hot water pipe in chamber	540	feet.
" " " round nurseries	110	"
Amount of air in rooms, corridors, etc.:		
Ground floor	18,832	cubic feet.
First floor	16,386	"
	35,218	"
Contents of foul air chamber	293	"
Area of downcast foul air shaft	5.72	sq. feet.
Area of upcast foul air shaft	3.81	"

No windows open, all being fixed and made air-tight. Each apartment—sitting rooms, bed rooms and closets—has a separate zinc extracting flue direct into foul air chamber in roof. Each flue is in size *in proportion to the cubic contents of the particular room the flues all enter.* The foul air chamber at same level, about 2 inches from floor. There are no gratings at all to the openings, or anywhere in these flues. York stone covering to slope of downcast shaft.

No. I.—Section through Primary Air Inlet.

No. II.—Kitchen Fireplace, showing means of Producing Current in Foul Air Upcast Shaft.

The London *Times* publishes an account of the measures taken by the Westminster Sanitary Aid Association, to prevent the spread of epidemic diseases. When information of the occurrence of an infectious illness is received through dispensary doctors, sanitary inspectors, school authorities, or others, the sanitary visitors of the association go to the house and take steps to insure the use of disinfectants, and, as far as possible, the isolation of the patient. Where complete isolation is possible, and it is too late to remove the patient to an hospital, extra bedding, sheets, and blankets are lent for the use of other members of the family, so that the sufferer may not have to sleep with those as yet unattacked by the disease. A small house has been taken in which two rooms are available for the reception of poor people during the time necessary for the proper disinfection of their own lodgings, and where an unaffected member of a family in which a case of infectious disease had occurred might be lodged, so that the means of livlihood might not be lost or the infection spread. Here, also, clothing and other things are received, and disinfected. As proof of the success of the measures taken by the association to prevent the spread of infectious diseases, it was mentioned that in only four cases had they been unable to confine the illness to the individual patients already attacked.

The Government of India causes a sanitary primer to be used in the schools. One hundred thousand copies of the publication have been circulated in fourteen different vernaculars.

HOW THE PLUMBING LAW IS ENFORCED IN NEW YORK CITY.

The following description of the methods employed by the Health Department of this city, in the enforcement of the plumbing law will be found especially interesting at this time when similar regulations are being agitated and adopted in other cities, particularly to the officials entrusted with the execution of such regulations. For the information required in the preparation of this account we are indebted to Mr. John C. Collins, who has charge of the plumbing plans and specifications.

The law in question was passed June 4, 1881, and took effect immediately. In brief, it requires that the drainage and plumbing of all buildings, both public and private, shall be executed in accordance with plans previously approved by the Board of Health, and grants to any court of record or any judge or justice in the city the power to restrain by injunction order the further progress of any violation, or of any work upon or about the building or premises upon which the violation exists. It also requires the registration of every plumber at the Health Department. The full text was printed in THE SANITARY ENGINEER of June 15, 1881, Vol. IV., page 327.

In accordance with this law rules and regulations were prepared by the Board of Health setting forth the plan of drainage and plumbing approved by them, issued in pamphlet form and distributed among plumbers. The substance of these rules and regulations, in the form of a specification required to be approved by the Board, is given in THE SANITARY ENGINEER of Dec. 14, 1882, Vol. VII., page 34.

To see that these regulations are carried out, five inspectors are employed, each of whom has charge of one of the five districts into which the whole city is divided. Before beginning the construction, owners are required to submit plans of proposed buildings to the Bureau of Inspector of Buildings for approval. A list of these projected buildings is printed every week in several papers. This list is utilized by the Health Department to secure the enforcement of the law requiring the submission of a plumbing plan for every building containing plumbing, as follows: A scrap book is kept in which this list is pasted as soon as it appears. The inspectors have access to this, and each puts his initials opposite every building proposed in his district and enters it in his note-book. Also, on the same day this list is received the following circular letter is mailed to the owner of every projected building.

HEALTH DEPARTMENT, NO. 301 MOTT STREET.
New York,..... 188

To.....
.....
SIR: Plans for a new building at
No..... .....
having been filed by you in BUREAU OF INSPECTOR OF BUILDINGS, your attention is respectfully called to Section 3, Chapter 450, Laws of 1881, which requires that the drainage and plumbing of all buildings—public and private—shall be executed in accordance with plans previously approved in writing by the BOARD OF HEALTH.

Before commencing any part of the work of drainage or plumbing of the above named premises, you are required to present the plans and specifications for the same to this Department and obtain the approval of this Board. Blank specifications and all necessary information may be obtained at this office.

Builders are especially cautioned against *laying drains* to connect with the street sewers, without the previous approval of the Board of Health.

By order of the Board of Health,
EMMONS CLARK, *Secretary*.

If this notice is not heeded and any work on the drainage or plumbing is begun without submitting a plumbing plan the fact is reported by the inspector of that district, and notice of violation is issued and served personally on the owner. If this is not heeded after a reasonable time, the matter is referred to the attorney of the Board who obtains an injunction on the house restraining further work. It is, however, very seldom necessary to take this measure.

The principal plan required for the plumbing and drainage is an interior elevation showing the position and arrangement of fixtures with the traps, and waste and ventilating pipes. A ground plan is however required where the run of the house drain is not direct to the sewer or there is anything peculiar in the arrangement of the drain. Duplicate specifications (blank forms of which are furnished by the Department), are required to be filed with the plans. One copy is retained on file at the Department and the other, when the plan is approved, is returned to the owner (or architect), with the written approval of the Board endorsed on it, and the conditions or amendments imposed being stated in detail. This is designed to be turned over to the plumber to be used by him in doing the work.

The plans and specification are carefully examined by the clerk in charge as soon as they are handed in, and an analysis made of them. They are then numbered and entered in the record book, with the name and address of the owner, builder and architect, and the class of buildings to which it belongs—whether tenement or private house, factory, stable or some other. The plan then goes before the Board with specification and analysis. It is examined carefully by the Commissioners and passed if approved. If found defective in details only, it is "tabled for amendment," the Commissioners having indicated what changes are necessary; the owner is notified and sends in and makes the necessary changes and gets his approved copy of specifications. When the plan and specification contain some arrangement contrary to the rules and regulations, it is approved conditionally, the conditions of approval being stated in detail upon the specification. But if it is found radically defective, it is disapproved and the owner is required to submit new plans.

Lists of the plumbing plans approved by the Board of Health are published in the *City Record*. These are also clipped and pasted in the same scrap book as the lists of projected buildings. From these the Inspectors get the plumbing plan numbers, which they enter in their note books opposite the buildings, the location of which had been previously taken from the list of projected buildings. This enables the Inspector to determine by a glance at his book whether a plumbing plan has been filed and approved for any given house in his district.

One of the conditions of the plumbing specifications requires the plumber to send a notice to the department when the house drain and sewer will be ready for inspection. This notice is forwarded to the inspector, who keeps a constant oversight of all the houses in his district from the time they are commenced till the plumbing is complete, visiting each house many times. Any defect or failure to comply with the plans and specifications discovered by him is made the subject of a special report to the Secretary of the Board (on a blank provided for the purpose), specifying in detail the nature of the violation, care being taken in framing the report, so that the same may be used by the attorney as evidence if the violation is not removed. The following notice is then made out in duplicate:

HEALTH DEPARTMENT, NO. 301 MOTT STREET.
New York,..... 188

Notice of Violation.

....
.....
SIR: It has been reported to this Board that the plumbing work now in progress in the .....house....in course of erection at..... .... is in violation of law and the Plan and Specifications (No.....) heretofore approved by this Board; and you are hereby notified that unless the said plumbing is made to conform to said plan and specifications within... .... days, from the date of the service of this notice, the case will be referred to the attorney of the Board to enforce the law.

Respectfully yours,
EMMONS CLARK,
Secretary.

Following the above, at the bottom of the same page of the notice, is an extract from the law comprising the two most important sections. One of the two copies is then affixed to the inspector's report and given to the officer who is to serve the other. The officer reads to the plumber the inspector's report, after giving him the duplicate notice of violation, and returns the other with his endorsement of personal service and the date. At the expiration of the specified time allowed for the removal of the violation, the inspector visits the place, and if he finds it removed he so endorses the notice, and if it is not removed he so endorses it. In the latter case it is referred at once to the Board's attorney.

At the time of issuing the notice of violation, an entry is made of it in the "Violation Book." The entry includes the inspector's name, the plan number, the location and number of the buildings, the number and date of issue of the notice, the owner's and plumber's name, the date on which it is referred to the attorney, the record of proceedings and final disposition of the case. These are arranged in columns. The book is constanly referred to instead of handling over the papers, and is used in making up statistics, etc.

The plumbing plans and specifications of all buildings are filed in numerical order at the department, and to these the inspectors can quickly refer (having the plan nnmber in their note-books of every building in process of construction in their district), and learn whether the work in any building is being done in accordance with the plan as approved. Each inspector submits a weekly report, stating the number of buildings in his district in progress, the number containing plumbing, the number of inspections made, etc. From these and from office records, the Secretary makes a weekly report to the Board, stating the number of plans filed, the number approved, the number found radically defective, the whole number of buildings in the city commenced during the week, and the number in progress, the number of violation notices issued, the number of cases referred to the attorney, etc.

After an inspector has made his final examination of a building and found everything satisfactory, he fills out the following blank:

HEALTH DEPARTMENT.

Inspector's Report on Plumbing and Drainage.

Location.....
No. of Houses .....Plan No.....

Traps: Is each water closet, sink, basin, wash tray, bath, and tub or set of tubs separately and effectively trapped?.....
Trap Vent Pipes: Material?.....
Diameter for water closets?.....
Diameter for traps of other fixtures?.....
Diameter of branches?.....
Is each trap connected with a separate vent pipe extending above roof.....or tapped in above highest fixture?.....
Height above roof?.....
Diameter above roof?.....
Connections: How made?.....
Safes: Material?.....
How drained?.....
Refrigerator Wastes: Where discharged?.....
Are pipes arranged for convenient flushing?.....
Water Closet Cisterns: Is each water closet or set of water closets provided with?.....
Are they adequate and properly arranged?.....
Where is overflow discharged?.....
Is water supply adequate?.....
Is there a pump?.....
Is a pump necessary?.....
Cisterns for drinking water: Material?.....
How lined?.....
Overflow, where discharged?.....
Leaders: Location?.....
Where discharged?.....
If in house drain, are they trapped?.....
Material?.....
Steam Exhaust: Is any connected with soil or waste pipe?.....
Cellar: How drained?.....
Cellar Walls: Are they impervious to dampness?.....
Cellar Floor: Material?.....
Is it impervious to dampness and gases?.....
Yards and Areas: How drained?.....
General: Quality of material?.....
Workmanship?.....
Have all pipes sufficient fall?.....
Will pipes and fixtures be so exposed as to permit ready inspection in future?.....
Roof: Distance of openings of soil and vent pipes from windows and shafts?.....
Remarks:.....

.....
Ass't Sanitary Engineer.

This is filed with the specification as a record of the plumbing and drainage of the house and, in connection with the plans, furnishes any one who will take the trouble to inquire for it at the Health Department with a description of the work done in any house. This information is frequently sought by parties looking for a healthy home.

VERY BAD PLUMBING IN A FACTORY.

The following interesting plumbing work in the new factory of the New York Wood Turning Company on 134th street, east of Lincoln avenue, was discovered some weeks ago by Mr. Hooper, Plumbing Inspector of the Health Department of this city. His report was verified by our representative, who visited the premises before the work had been altered and made the accompanying sketch, which does not need much explanation to make evident the stupidity of the arrangement. The 4-inch iron pipe under the urinals was almost exactly horizontal, while the waste pipe under the basins inclined slightly in the wrong direction, so that it would remain full. The basins were not trapped separately, but had direct connections with the horizontal waste.

The arrangement of ventilating pipes was such, it will be noticed, that the 4-inch horizontal waste pipe was connected directly with the air of the room through the urinals. The 4-inch vertical pipe, with which the galvanized iron ventilating pipe is connected, goes up through the roof, for ventilation only. Beyond it are four or five water closets on the same line of drain, which then passes direct to the street sewer through a running trap, which had no fresh air inlet except a trapless rain-leader between the main trap and the closets. A pipe had, however, been taken from the *sewer side* of the trap to the sidewalk, but

this had been plugged up. The above conveniences are on the basement or cellar (ground floor), and are for the use of the workmen.

In a room adjoining the office on the street floor was another equally stupid arrangement. The fixtures here are on another line of drain which has a separate connection with the sewer. As the building is a one-story structure, and there are no fixtures above these, the vent from the water closet trap had been taken into the soil pipe by a short connection. *Into this connection was branched the ventilating pipe from the top of the urinal*, only three or four feet away. The book-keeper said he had noticed a bad odor and had poured water into the urinal to restore the seal of the trap, thinking it might have been lost, seeing no other way in which "sewer gas" could get into the room.

There were other things almost as bad in the girls' room, but we think the above is sufficient. This work was not done by a licensed plumber, but under the direction of the superintendent of the factory, by a young man, almost a boy (who, however, seemed to be a good workman, made good joints, etc.). When a Board of Health Inspector pointed out the defects to the superintendent, and told him what changes must be made, he seemed quite willing to make them and anxious to have everything properly done. The changes recommended have been made, we understand, but not without some difficulty. The interesting question here comes, in who violated the law, the boy or the superintendant? In other words, who assumed to be the plumber? It does not appear that either was was registered.

The Paris Academy of Medicine offers a prize of $5,000 to anyone who may discover a remedy against diphtheria.

THE HEATING AND VENTILATION OF A SCHOOL BUILDING.*

The location and exposure of a school building are of importance in connection with its heating and ventilation, partly in relation to the purity of its air supply and partly because the winds have a much greater effect upon the movements of the air *within* a building than is ordinarily supposed; and this is especially the case in a building constructed of ordinary brick and mortar, with common plastered walls, not painted, papered, or calcimined, which is the case with our ordinary school buildings. In a building of this kind, freely exposed to a strong wind, there is a very decided movement of air through the windward side, and a corresponding tendency to an exhaust through the opposite side. This tendency is sometimes so strong that the openings on the leeward side which were intended for inlets of fresh air to the heating surfaces have their action reversed, and will be found acting as outlets, in which case it is by no means impossible that what were intended to be foul-air flues for the building will be found to be acting as inlets, as I have actually seen the case in a school building I examined.

The location and exposure should be distinctly noted, including the altitude of the site, the distance of surrounding buildings, the prevailing winds, etc. The vicinity of marshes, pools of stagnant water, and buildings in which trades and manufactures liable to give forth offensive emanations are situated, should also be noted. The plan of the lot should be given, and upon it should be located the building, giving dimensions, so as to indicate distinctly the amount of ground not covered by the building and the location of drains, sewers, and cesspools outside the building, but connected with it. The next thing is to prepare copies of the floor plans of the building, with a section showing the height of the several stories. The dimensions of all windows, doors, and flues should be noted; also the existence of transoms over the doors. The amount of clear opening in the registers for each flue should be indicated, together with the number of desks and the number of children actually in the room at the time of making the observation. The length of time which these children have been in the room since the last recess should also be noted. The temperature of the outer air and that of the room near the floor and near the ceiling, within two feet of the inner wall and in the same position relative to the outer wall should be taken; also the temperature of the incoming and outgoing air. This is necessary to enable one to judge of the distribution of heat in a room, and to a certain extent is a very good index of the distribution of the fresh air. It is also desirable that the amount of moisture in the air as determined by the hygrometer should be observed and recorded, similar records being taken of the amount of moisture in the external air. The next step is to ascertain the amount of air which is actually entering and leaving the room by the special openings and flues provided for that purpose. This is to be done by means of an instrument called an anemometer In making such observations it will be found that there is a great difference in the amount of air passing through the several flues, dependent on the direction and force of the wind, and also to a great extent as to whether the doors, and the transoms over the doors, of the school rooms be opened or closed. In a school building of several stories, where the doors open into a large central hall containing a staircase, which is a common plan of construction, it will usually be found that a large proportion of the change of the air in the school rooms is effected through the doors and transoms, and outward and inward currents will be found in the doorways near the floors and at the top of the openings.

It would be a great error to suppose that only the amount of fresh air indicated by the anemometer in the flues provided for that purpose is actually entering the room. Were this the case, a great majority of school rooms would soon become uninhabitable. As a matter of fact, a very large amount of fresh air enters directly through the walls, another part around the windows and through cracks at the junction of the floor and wall and a third source of supply comes from the central hall, as just indicated.

Although the anemometer is a comparatively simple instrument, there are, nevertheless, one or two precautions necessary in its use, to which it may be well to call attention. In the first place, the accuracy of the instrument should be carefully tested, not only when it is first received but at intervals subsequently. The usual mode of testing is to swing them in a circle at the extremity of a bar of a known length and note the registration. A simpler method is to walk rapidly a measured distance, say 200 feet, in a covered space, where there are no currents of air, holding the instrument at arm's-length above the head, or, better, attached to a short rod, with the plane of the wheel perpendicular to the direction of the movement. It is difficult to ascertain precisely the amount of air flowing through a register by the use of the anemometer, if the instrument be merely held in front of the register. The best way is to cover the entire register with a sort of truncated cone, made of light board or pasteboard, freely open at both ends, and having the large end fitting close against the wall over the register, the smaller end having, for convenience of calculation, an area of one square foot. This cone should be from one foot to 18 inches high.

I must warn you against the error of supposing that all the air coming from the top of a heating apparatus placed in the room itself and connected with the outer air is to be counted as fresh air supply. In all cases a very considerable amount of this air is derived from the room itself, and rolls up along the side of the heating apparatus, be it ventilating stove, steam coil, or what not, and aids in forming the current which the anemometer shows to exist over the radiator. In all such cases the true amount of air which is entering from without can be found by testing the current with the flue from the external air closed and then open, and noting the difference.

Nor can the amount of air entering at the inlet flues or found to be passing out of the outlets be taken as an absolute indication of the amount and character of the ventilation of a room, for it is possible to pass a very large amount of air through a room without really ventilating it, and this will always be the case where the air is admitted at a high temperature and allowed to escape through openings at or near the top of the room. It is necessary therefore to obtain some information as to the distribution of the fresh incoming air as well as its quantity. This information is to be obtained partly by the use of visible vapors, or light substances which will indicate the direction and force of the air currents, and partly by chemical analysis.

Of the various means of showing the direction of air currents, one of the simplest is by the fumes of freshly generated muriate of ammonia produced by bringing the vapors of the common liquor ammoniæ of the shops in contact with the vapor of hydrochloric or muriatic acid. These fumes can inhaled without discomfort or injury; in fact, they are sometimes used for the treatment of chronic inflammatory troubles of the air passages. The cost of their production is very small and they can be generated in any amount desired. Even these, however, give but a very partial idea of the distribution of the air within a room. This can only be ascertained by taking samples of the air at different points in the room and subjecting them to chemical examination. I wish to emphasize here the fact that carbonic acid gas, in the proportion in which it is found in the worst ventilated school rooms, is not in itself poisonous, offensive, or harmful. The really dangerous and offensive impurities are the organic matters thrown off in respiration, and as these increase the carbonic acid increases in like proportion. Now, the testing for these organic matters, in a quantitative point of view is a very difficult and delicate process, whereas the examination for carbonic acid is, as you will see, comparatively simple; hence, the chemical test of the quality of the air is made by the analysis for carbonic acid, which is taken as an index for the really harmful impurities existing.

If the water closets are placed in the basement of the school building, in a room having a cemented floor, for purposes of cleansing, it is very common to have this floor slightly sloped towards one point, and at that point to place an opening into the sewer so that the whole floor and closets may be washed by means of a hose, and the resulting water readily gotten rid of. This opening to the sewer is usually guarded by means of what is called a bell trap, which is, however, in nine cases of ten found to be totally ineffective. In two out of three cases in which I have recently examined these arrangements in Washington schools, I found a strong current of air from the sewer passing up from this so-called trap into the basement, from which it passed freely up the staircase into the main hall, and became a part of the source of supply for the school rooms, as I have already explained.

If the closets are placed within the building, it should be noted whether the soil pipe is properly ventilated, that is to say, whether the pipe into which the closets discharge is continued up through the roof and left freely open at the top, and has also a fresh air opening into it from the outside of the building. If the closets be outside of the building the point of discharge of their ventilation pipe should be noted, as to whether it is above or below the level of the windows of the upper rooms in the main school building. A very frequent source of unnecessary contamination of the air supply of a school building is connected with the heating apparatus. This may occur in

* Condensed from a paper read by Dr. J. S. Billings, U.S.A., before the National Educational Association.

Digitized by Google

two ways: first, as the heating apparatus is usually placed in the basement, which communicates freely by stairways with the upper hall, any checking of the draft in the fire causing escape of gases from the furnace into the basement will contaminate its central air supply. This is liable to occur, whatever may be the form of heating apparatus. The second mode of contamination is by the air of the basement, rendered impure in various ways, passing into fresh air ducts through cracks, leaks, etc. This is especially liable to occur in systems of heating by hot air furnaces, and the fittings of these should be carefully examined.

As a rule, in all school buildings warmed by the so-called methods of indirect radiation, that is, by hot-air furnaces or by steam coils placed in the basement, the air enters the room at a comparatively high temperature, too high, in fact, for either comfort or health. The only way of controlling the temperature of the room in the way of reduction is to partially or entirely shut off the air supply by closing the register. No heating or ventilating apparatus which operates in this manner can be considered satisfactory. In all cases it should be possible by the operation of a valve to permit more or less cold air to mingle with the heated air, and this should be done in such a way that the temperature of the air admitted into the room can be regulated without at all diminishing its quantity.

A complete idea as to the merits of the system of heating and ventilation of a building can only be obtained by a series of records of the effects produced by it under various circumstances of external temperature, moisture, wind, etc., the amount of coal burned, and the effects upon the health of the pupils. Take, for instance, the records of temperature. These should be taken twice in each school session, once just as the school assembles, and again just before it is dismissed. They should be taken in different parts of the room: at the entrance of the fresh air, at the point of discharge of the foul air, at the level of the children's heads, and on the floor. The most important record, however, is that which relates to the health of the pupils. It seems at first sight somewhat curious that there should be so little scientific evidence obtainable as to the effects of over-crowded, over-heated rooms, and impure air of various kinds upon the health of school children. I have repeatedly found, in going into school rooms, where the air was so impure as to be decidedly offensive to the sense of smell to one entering from the outer air, and where the carbonic acid ranged from twenty to thirty parts in ten thousand, that upon inquiry, the children, or at least a great majority of them, made no special complaint of ill-health, nor was it possible to show from their condition, as observed, that the foul air was having a bad effect upon them. This want of evidence is due in part to the great power which the childish organism has of accommodating itself to circumstances, and in part to the fact that the evil effects of impure air are remote rather than immediate, and show themselves at periods from one to perhaps twenty years after the exposure.

It is so highly desirable that a systematic record should be kept of the health of children and teachers and the results which would obtained from a comparison of such records for a number of school buildings in different cities would be so valuable that it certainly seems worth while to make at least an attempt to obtain them. I am quite aware of the difficulties in the way of making such records complete and accurate in all respects. Nevertheless it does seem possible that when a child is first admitted to a public school a record could be made of its physical condition, including powers of vision and hearing, height, weight, etc., and that thereafter all absence from school on account of alleged sickness should be so noted, as well as the character of the illness, so far as this can be ascertained. In this connection, I would invite your attention to the means used in some investigations undertaken by Prof. Henry P. Bowditch, of Harvard University, respecting the laws of growth in children as shown by investigations made upon school children in Boston.

These data are collected upon cards, of which specimens can be obtained from Professor Bowditch, and of which the following is a copy:

FOR SUCCESSIVE SETS OF OBSERVATION—FEMALES.

Record all linear measurements at nearest centimetre; all weights. at nearest kilogram.

Name (or initials), —— ——; birthplace, ——

	1882	1883	1884	1885	1886	1887
Age ....y. m..						
Height without shoes..cm..						
Sitting height .....cm..						
Finger reach.....cm..						
Chest girth, inspire ...cm..						
Chest girth, expire ....cm..						
Weight (in ordinary indoor clothes) ..... kilo..						

Nationality of father,——; mother,——; paternal grandfather, ——; paternal grandmother, —— maternal grandfather, ——; maternal grandmother, ——.

Color of eyes, ——; color of hair, ——.

Occupation (of husband if a married women) (of parents if a minor), ——.

Name (or initials) of observer, —— ——.

Reverse side.

The height is to be taken in an upright position, without shoes, the feet being close to the measuring rod. If, in the case of infants, it is necessary to measure in a recumbent position, the fact should be stated.

The sitting height is the vertical distance between the top of the head and the surface upon which the individual is seated.

The finger reach is the distance between the tips of the middle fingers when the arms are extended horizontally, the breast and arms being in contact with a wall. The chest girth should be taken after a forcible inspiration, and also after a forcible expiration, the measuring tape being passed horizontally round the chest on a level with the nipples, over only a single garment. This measurement is to be taken only on men and children.

The weight is to be taken in ordinary indoor costume. In the case of children less than ten years of age, it is to be recorded at the nearest tenth of a kilogram.

The color of the eyes is to be recorded as blue, gray, brown, or black.

The color of the hair is to be recorded as fair, golden, red, brown, black or gray. If gray record also, if possible, the original color.

The nationality is determined by the place of birth.

The occupation should be given so as to indicate as far as possible the degree of comfort in which the individual lives.

Separate colored cards are furnished for males and females, and also distinct colors for a single set of observations and for successive sets of observations.

I have satisfied myself that such an account could be kept by the teachers with comparatively little trouble and I feel assured that the results would be of great value. In fact, what we need above all things at present, as regards our public school buildings, is a system of accounts which shall show, not only the cost of their construction and repairs, which is merely one side of the question, but their effects upon the health of the children and teachers who are to spend no inconsiderable time in them. That a comparison of such records would lead to changes and improvements in the plans and methods of construction of school buildings which would be in the direction of true economy as distinguished from cheapness there can be little doubt.

Correspondence.

THE ALLEGED EXPLOSION OF SEWER GAS.

CINCINNATI, O., *Feb.* 27, 1883.

To the Editor of THE SANITARY ENGINEER:

I send you herewith a report of the facts in the case of the Wilstach street explosion, which was to-day forwarded to the Board of Public Works.

From this your readers may judge how improbable it is that sewer gas had anything to do with it. Only one thing is necessary for a full understanding of the situation, which is not explained in the report, and that is the nature of the fills around the house. The streets and the lots in this vicinity are all filled about eighteen feet above the natural surface level, and these fills are made principally with street dirt and ashes, with a large percentage of *garbage* mixed therewith. The house that was destroyed was the last one erected on the north side of the street and was surrounded by these fills.

I might add that the house in question had gas connection, and as an explanation of the water in the cellar without sewer connections, I will state that the streets and adjacent lots were overflowed or flooded by the extreme high water.

Yours truly, A. E. TRIPP.

CINCINNATI, O., *Feb.* 26, 1883.

H. J. STANLEY, *Esq., Chief Engineer:*

The coroner having ascribed the cause of the explosion on Wilstach street, on the morning of the 15th inst, to sewer gas, I submit, for the information of the Board of Public works, the facts in the case:

First, With reference to the sewer in Wilstach street, said sewer is the completed part of a 2' 8" x 2' oval brick lateral to McLean avenue sewer, built from Dalton avenue 425 feet eastwardly, terminating at a catch basin, and with a man-hole near the terminus. There is also a man-hole at its beginning which is temporarily connected with the Liberty street sewer through Dalton avenue. There are six connections with the sewer on Wilstach street, *but the house which was destroyed had no sewer connection.*

Moreover, on account of the depth of the sewer and the stage of the river on the 5th inst (ten days before the explosion occurred), the sewer was on, and from that date, full of water, and any gases it might have previously contained must have been forced out through man-holes and catch basin, or possibly, in part, through its other connections, though these would be filled by the rising water when the sewer was one-half full.

Second, I submit a copy of the record, from the coroner's office, of the verdict and the testimony upon which it was based.

"INQUEST NO. 31:—VERDICT.

"After having examined said bodies and heard the evidence, I do find the deceased came to their deaths from injuries received by fall of building No. 51 Wilstach street, said fall occasioned by the explosion of sewer gas in the cellar of said building.

Signed, C. S. MUSCROFT,
Coroner.

"Mrs. K. Hammel makes oath, and says: I do not know what caused the house to fall. I kept coal in the cellar, and there was water in the cellar. I was unconscious after the house fell.

"H. Richards, Jno. Myers, Mike Sparth, John Collins, and James Farrell, testify to assisting in removing the bodies, etc., nothing about cause (all policemen). Bernard Schutte was in the street opposite the house; saw the boys go into the yard to get something for the raft they were making. Saw a light and heard the explosion.

R. B. Davy, M.D., testifies, that Jake Braun, the one who carried the lamps into the cellar, told him that he went into the cellar with a lamp to get some wood, and that he heard first a hissing noise and then a heavy sound. He said he saw fire flash up and then was stunned.

Jacob Braun, was in the house about ten o'clock Wednesday. I went into the cellar with a light and measured the water; there was about five feet. My wife and I then went to bed. The next thing I knew was when the explosion * * It was a very loud noise. My wife and I were fastened in the ruins. In a short time help came and we were taken out.

John Henry Macke testifies, to being brother of dedeceased.

August Bouman testifies to hearing the explosion.

Henry Korman testifies to seeing the boys go into the * * with a lantern, and immediately after the explosion took place. Saw the house fall. Sergt. Godfrey Pistner helped remove the bodies.

Thos. O'Connor says above is correct.

John Ambrose helped remove the bodies (Patrol Squad)

Anthony Corry says above is correct.

Thomas Finn, policeman, same.

There appears to be nothing in the above testimony pointing to the cause of the explosion, and I think that the above facts with reference to the sewer in the street will exonerate the much abused *sewer gas* from any participation in this disaster.

I also submit an article clipped from THE SANITARY ENGINEER of the 22d inst., a perusal of which, with a knowledge of the nature of the fills in the vicinity of the explosion might throw some light on the question.

Respectfully,
A. E. TRIPP, *Ass't Engineer.*

WASHINGTON MASTER PLUMBERS AND THE PLUMBING REGULATIONS.

WASHINGTON, D. C., *Feb.* 19, 1883.

To the Editor of THE SANITARY ENGINEER:

In your issue of the 8th inst. you published the communication sent you by me by order of the Master Plumbers' Association of this city, and also the regulations governing plumbing in this city (a copy of which I enclosed with the communication).

You proceed to criticise the action taken by the Association in a manner which I do not think we deserve.

You accuse us of complaining "because," as you say, "a restriction is placed on us doing cheap, otherwise, skin work." You say instead of making complaints we should do what we can to sustain the law, and that the time has gone by for any set of men calling themselves plumbers to oppose the enforcement of reasonable plumbing regulations.

This does us injustice. Although in revising the regulations our suggestions have been almost entirely ignored, we have labored to sustain and have them uniformly enforced, which they never have been, are not now, and never will be under the existing state of affairs.

The inspector's time, when he is not in his office, is too much taken up inspecting (by request of tenants) old work over which he has no control, and if the owner consents to comply with the inspector's recommendations, it is generally the case he only has enough work done to deceive the tenant into the belief that the work has been put in a modern sanitary condition, and if the inspector's attention is called to the fact that the regulations have not been complied with, he replies he cannot enforce them on old work. In the meantime, new work, extensions, and extensive alterations, to which the regulations apply, are all being done, with few exceptions, with bad workmanship, and in direct violation of the regulations, both by bonded and unbonded plumbers, and unbonded men who are not plumbers, of which the two latter will soon equal the former in numbers, as we hear of them every day, and they go about and tinker here and there unmolested by the authorities.

We do not wish the privilege of doing skin work, and we do not want to be called skin plumbers because we question the necessity of some of the requirements of some of the clauses which tend to increase the cost of plumbing. For instance, we do not approve of its being made obligatory to build a man-hole over each running trap, at a cost of from twenty-five to thirty-five dollars (although it is undoubtedly the most convenient means of reaching the trap); but when the trap can be made

Digitized by Google

sufficiently accessible for ordinary cleaning through the fresh air inlet, why require this expense?

We do not approve the use of iron pipe being made obligatory at an increase of cost from fifty to one hundred and fifty per cent. I believe the principal objection made to terra cotta is that the joints are less likely to be made perfect than those of iron are. We claim that if the inspector performs his duty, and sees that the joints are made tight and the material used be of good quality, the pipe laid on hydraulic concrete to prevent settling, there certainly can be no question of the superiority of terra cotta to any other material for house drains laid in the ground.

There are some other things objected to by men here who certainly are not considered skin plumbers.

We do not oppose the enforcement of reasonable plumbing regulations; quite the reverse, we approve of such, but at the same time we demand that they be enforced, and let not the law makers be the first law breakers, and let them act consistent with the law they make to govern us.

To illustrate how inconsistent with the requirements of one clause of the revised regulations is the action of our commissioner, please note the enclosed printed slip, headed, "Why Terra Cotta Pipes will be Used." Looks all right on the face, does it not? proper enough you will say, as the contract was made previous to the revision of the regulations. But why do they require iron pipe now at all, when they formerly allowed terra cotta? is it because they have concluded the terra cotta cannot be made safe? If so, why will they allow it to be used now, (even though the contract is made) under three school buildings where as yet not a foot of sewerage has been laid? If, in their opinion, terra cotta is not safe, why not pay the additional cost of iron? on the other hand, if terra cotta is safe for these buildings it is safe for all others.

In the meantime, we have a gentleman from the Inspector of Buildings' office (a carpenter and builder by trade, an excellent building inspector), performing the duties of plumbing inspector in place of the regular inspector, who is afflicted by the loss of two children by scarlet fever, and serious illness of the others. Shows the necessity of an increase of the number of inspectors, does it not? Respectfully yours, E. G. L.

[Our criticism was on the action of the Association in endorsing the letter of Mr. Caverly to the *Star* in its *entirety*, without modification or qualification.

The parts to which we took exception were those designating the regulations as "a most unwarrantable exercise of power over private rights;" "plumbing work in the line of luxuries, available only to the rich and well-to-do."

The line of argument as indicated in these extracts, we critised as being the same that skin builders have invariably adopted, and that view we still maintain. The other portions of Mr. Caverly's letter and the Association's endorsement of them we should not have criticised in the same way, though we regret to see these controversies brought before the public.

Our correspondent's defence of the action of the Association is certainly courteous and plausible, though he seems to labor under the apprehension that it is proper to require one kind of work for the rich and one for the poor. This is the idea of men who sell adulterated food—that "the poor can't afford to pay for the pure article." There never was a greater fallacy than the idea that the poor should be permitted to have cheaper plumbing than the rich. In the matter of the needless accessories, elaborate finish and surroundings, they, of course, should not be insisted on; but a well jointed iron house drain, which is indispensable in our opinion, does not come under the head of "luxuries."

If any one can afford to take chances with cheap plumbing it is the rich. Sickness with them does not deprive their families of support. With the wages earner it is a very different thing. The question of per cent. on the cost of a drain should not be considered; indeed, it would have been fairer to have stated what this extra cost would have been in dollars. The assertion that because tile pipe had been used and was permitted up to a certain time, and that contracts made prior to that time were exempted, is no argument against a change if it is thought desirable. In all such matters the line has to be drawn somewhere and from some date. Outside a house the Board of Health of this city permit a tile drain to be laid under certain conditions. When those conditions are fulfilled it undoubtedly makes a good job, though the cost of doing it is fully that of the iron drain.

Now, as to the alleged inadequate enforcement, it is not charged that the inspector neglects his duty, but that he has not sufficient assistance. If that be the case, would it not be better for the reputable plumbers to do what they can to secure the appropriation of funds so that it would be possible to employ an additional force of inspectors? To assail in the public prints the efficiency and ability of the authorities is hardly the way to secure for them the additional funds that it is evident are needed.

In conclusion, we would distinctly state that we do not intend by anything we have said to uphold the health authorities in the violation of ordinary courtesies in their dealings with the Association, if such has occurred, and in any event we trust the authorities and the reputable plumbers will try to work together, and not weaken the position of both sides by indulging in public controversies over details that can and should be settled among themselves.]

ARCHITECTS' SPECIFICATIONS.

NEW YORK, *March* 1, 1883.

To the Editor of THE SANITARY ENGINEER:

There are two points in regard to the proper filling out of architects' specifications which I should like to ask your opinion about. As you are well aware, most architects are not as careful as they should be in drawing such specifications, and to tell the truth, few of them have the practical knowledge to qualify them for this work. In consequence, they usually are compelled to revamp some old specification for another building, or to ask a plumber to draw it up for them. Everyone is familiar with the loose kind of language which is used in such documents, and it is not an easy thing to know whether to follow the specification literally or to use one's judgment in carrying it out. For instance, I lately had occasion to do a job of work in which the specification simply mentioned waste pipe for basins and urinals of a given size, 1¼-inch, without saying anything about the weight of the pipe. The plumber, therefore, put in light weight pipe, and when the fact was discovered after the building was completed, he claimed that he was not bound to put in the heaviest material unless it was distinctly specified. In another case, a number of bids were received for the plumbing of a large building. The specification mentioned only drain pipe of ordinary weight, and some of the bids were based upon this reading, while others estimated upon extra heavy pipe. The architect intended to call for the latter material. The difference in cost between the light and heavy pipe made quite an item in the estimate, and it was said that if allowance had been made for this the work would have had to be awarded to another than the man who really received it. This is a subject worth commenting upon in your columns. W.

[It is a very common complaint on the part of conscientious plumbers who are called on to estimate on indefinite specifications that they know what is expected and what should be done, and having a regard for their reputation, and a desire not to disappoint the owner, they estimate accordingly, and, as a matter of course, are underbid by men who are sharper, and who propose to demand extras, or else do nothing beyond what is actually specified. Under the circumstances, when work is let out in competition, the contractor cannot be expected to do more than the specification calls for. It is such omissions that result in poor jobs, or bills for extras, and there is a certain class of men who prefer to bid on just such apologies for specifications, taking their chances on the extras.]

MONTREAL, *Feb.* 4, 1883.

To the Editor of THE SANITARY ENGINEER:

In connection with the range explosion in a photographer's residence in this city, which is noticed in your last issue, there has been published the statement of a furnace builder that "the man who places a hot water back in a stove should be indicted for murder. If they put in a pipe, there will be no danger, for it will only rip;" and in connection with this the City Boiler Inspector, in his last annual report, recommended that people using hot water or air pipes should be compelled to put a safety valve on them. As several water backs have already exploded, as noticed in the papers, it is a matter of some practical importance to know whether the substitution of a pipe in place of a water back would lessen the liability of explosion, and whether any valve has been designed for use on water backs or their connections for such an emergency as that cited. Will you give your opinion, and oblige, A READER.

[It is possible that a wrought iron pipe might split and not fly into fragments after the manner of cast iron though we think where the superficial heating surface is the same, the results would not vary much. Short pieces of wrought iron pipe are often used, but they soon burn out, and do not heat water as rapidly as is sometimes needed. We know of no valve that can be depended on, indeed, nothing will take the place of care. We again refer you to suggestions on page 277, issue of March 2, 1882.]

PHILADELPHIA, PA., *Feb.* 12, 1883

To the Editor of THE SANITARY ENGINEER:

Enclosed find plan of a job I did last month. They cannot get any hot water. I have had the boiler down and found the tube all right and all the connections clean, but it does not make any hot water, and I am at sea as to what is the matter. I contend that it is the water-back and the way it is constructed, as the back sets in a cylinder cast for the range, and the heat goes over the back instead of striking it. There is no noise about the boiler, for it is a plain job and no traps. The range is an Excelsior hot air range. By giving your opinion you will greatly oblige C.

[From your description we should imagine that the water-back was placed too low to get the benefit of the heat of the fire.]

DR. HOWARD CROSBY'S LECTURE BEFORE THE MASTER PLUMBERS.

A large and interested audience was present last Thursday evening in Steinway Hall to listen to the lecture of the Rev. Dr. Howard Crosby before the Master Plumbers' Association of this city. His subject was the "Glory and Shame of New York." After describing the distinguishing characteristics of the city and its population—the large foreign element, with the remarkable assimilation and harmony of these with the natives, and the energy and common sense of the citizens—the speaker enumerated some of the things of which New Yorkers might be justly proud. The chief glory of the city was her public school system, which had not its equal anywhere in the world, he said: A comparison of the condition of the city forty years ago with that of to-day showed the most rapid improvement ever made in any city. Our great engineering works, as the Croton aqueduct, East River bridge and the elevated railroads were achievements in which we might well take pride.

The glory, was, however in danger of being overshadowed by the shame. This was of two kinds, political and social; but both were largely due to the same causes—"rum and the power of the rumseller." Men were elected aldermen, or to important offices in the city government, not because of any fitness for the place, but because they kept liquor saloons. Grog-shop influence was dominant in the city politics, and the government was practically managed by dirty, vulgar men, whom respectable people would not allow in their houses, There were 12,000 liquor saloons in the city, or nearly one for every 100 persons. Leaving out women and children, there was one for every 33 men, or one for every 18 drinkers. This makes clear the reason for the poverty, and misery of the poor: the patrons of the saloons support the liquor seller instead of their own families, and most of the poverty is the result of drinking.

This was the concluding lecture of the course. We congratulate the association on so interesting and successful a series of entertainments.

THE CHICAGO MASTER PLUMBERS.

At the meeting of the Master Plumbers' Association of Chicago, March 1, the following committee on further conference with the New York Master Plumbers' Association on the subject of coöperation, was appointed: Andrew Young, Chairman, and Messrs. Baggott, Boyd, Hamblin, Harvey, Livingston, Macey, Moylan, O'Malley, Roche, Sanders, Simms, Wade, Whiteford.

The following card to the public was approved:

"The Sanitary Committee of the Master Plumbers Association would recommend to those of our citizens whose cellars or basements were overflowed during the late thaws, a liberal use of disinfectants. A solution of copperas sprinkled over cellars and thorough airing of the same will be time and money wisely expended. A flooding of your cellars means a poisoning of the earth. Particular attention should be paid to the condition of air ducts and furnaces, and the connections of sewers examined and put in order."

The Sanitary Committee consists of Messrs. A. Young, M. Moylan, J. P. Hamblin, Robert Griffith, W. Gay, T. C. Boyd, P. Harvey, Geo. Alles, D. Whiteford, William Boyden.

PLUMBING LAW VIOLATIONS.

No very serious cases of violation of the plumbing regulations in this city were reported last week. Minor violations were reported as follows: By Inspector Eagleson, two, and by Inspectors Golden and Hooper, three each,

HEATING RAILWAY CARS.

To the Editor of THE SANITARY ENGINEER :

I take the liberty to ask you if the enclosed sketch is a fair representation of the inside of a New York elevated railroad car in winter time—at least in some of its characteristics—a noticeable one of which is the male passengers' gallantry. But the subject most dear to me and to the public, and the one to which I wish to call your attention is neither one of manners nor ethics, but one pertaining to *health* and the business of every one—I mean *warming*.

The cause of ill health is not so apparent in the picture, as the young woman having to stand is certainly in a better position to resist cold and to promote circulation, for she has not the cold air which is continually, and without intermission, falling from off the glass of the windows striking her in the back and shoulders in its downward course. Of course the cold air from the door still strikes her when it is opened, but as the exertion necessary to hang to the straps, as well as support herself otherwise, will maintain a tolerably brisk circulation of the blood, she is better off than he, who is too selfish to give her his seat But why should any one be exposed to the increased danger of catching cold, whether they are supplied with a seat or not ?

The currents of air within a car or room are always *down* where the cooling surfaces are, and that is why a man

with his desk in front of a window may have cold feet, though he is burned on the other side by the direct radiation from a red stove.

In the case of the car the whole outside and roof is cooling surface, and the current of air must pass down and over the seat to escape the floor or the centre of the car, near the floor, where it will ascend again to take the place of that which has fallen.

The greater the difference of temperature between the ascending and descending currents the more rapid the circulation will be, the rapidity aggravating the trouble by taking away more heat in the same time from the back of the unfortunate who may have to occupy the seat.

The fact of a warm current going up seems to surprise no one, and should a person place the hand over a radiator and find no warm air ascending, they would take it for granted it was not warm—that it was *cold*. But why do they not feel the cold air descending from the surface of the glass and draw the conclusion, it was *not hot?*

The fact is, the windows of a building or of anything else are its *coolers* and the radiators are its *heaters;* when the heating effects of the radiators preponderate the chamber is hot, and when the cooling effect of the windows is greatest the room is cold ; a mean in harmony with the surroundings is what is required.

If the volume of ascending warm air is the greatest and it is directly under the descending cold air, the result will be to neutralize it, and to reverse it if the heat is great enough.

This is as it should be; but if, instead, we place the heaters in such positions that the warm current has to pass up in a position remote from the cold one, how can the latter be prevented from falling?

In the car the passenger sitting forms the neutral line, the the cold current passing down behind and about him, and the warm one, or I should say the air (not very warm) forced up in front of him.

Even were the car warmed to be uncomfortably hot, so long as the air is allowed to fall in front of windows, if the air which comes in contact with the glass will be too cold to sit in, what is required in cars and what will prevent this state of things, is to send the warmed air up against the glass forcing a return current in the centre or at some other place.

The argument may be made, that the current falling in the centre is as bad as falling at the glass. But this is not so ; for if it does not come down in contact with the glass it will not be cold, though it may be slightly colder than the air current which takes its place.

The way to look at this, is prevent circulation and you will prevent a loss of heat unnecessarily; all coverings and non-conductors exemplify this.

The air cells are small and numerous, and the rotation of the air within them is slow according to their size, the friction being greater for small cells, and the ratio of loss of heat being in some inverse ratio to the layers of cells.

For this reason double glass saves much heat and materially changes the effect produced by the falling current. A curtain also of some loose and soft material will modify the effect of the glass varying from one-quarter to seven-eighths of all the effect according to the material used ; instance, the curtain in a sleeping car.

I now offer the suggestion as a remedy that the seats of railway cars (when they are parallel with the sides of the car) be moved two inches from the side of the car, as shown at *b* left side, so that the warmed air from the heater can pass up and counteract the cold current from the glass, when steam is in the pipes and when steam is not in them, that the cold air can fall behind the seat, and not over it.

The space under the seats of these cars where the heater usually is should be inclosed with numerous small openings near the the floor ; to admit sufficient air to the heater to supply the upward current and no more, and not as now all open, allowing every atom of heated air to be swept from the car every time the doors are opened, cooling everything, even the heater which is chilled in a manner many times greater than would be necessary to warm the car if the heat was properly supplied.

There is no patent on this nor on the arrangment as applied to cars.

Hoping this may prove interesting to the middle-aged and old, as it is they who suffer the most from cold currents, I am, very resp't yours,

THERMUS.

FEVER-PROOF COSTUMES.

There has been exhibited at the rooms of the National Health Society a novel dress intended for the protection of sanitary visitors, nurses and others who have to enter the rooms of persons suffering from infectious diseases. The garment is of mackintosh, glazed inside and out, and made completely to envelop the wearer and with a hood to cover the head. Thus only the hands and face remain exposed—a matter considered of comparatively little importance, as these can be easily washed with disinfectants. A not less important object proposed to be effected by the use of this dress is, that by its removal when the wearer leaves the sick room, the clothes which have been protected need not be changed, and the danger of the disease being carried from house to house, or communicated to susceptible persons in public vehicles, is obviated. A tight case for the fever-dress to be enclosed in is part of the invention. At the end of the day, or as often as may be convenient, the dress can be cleansed with disinfectants. Further protection is given by a simple form of respirator. This is made of two folds of thin washing net, between which is placed a layer of medicated cotton-wool, through which the wearer can breath, though no germs can pass. The respiratory has tape strings which tie round the ears. After use, the wool is burned and the net washed.—*London Times.*

There is here and there a saint among the many sinners. When the Legislative Prison Committee of Massachusetts were recently inspecting the Concord prison they found that a part of the sewage ran into the Assabet river. To the inquiry of one of the party whether the people of Concord did not object to this pollution of the river, the reply was, "Sam Hoar has an objection, that's all." So at least one clean man remains in the classic Concord.

ELECTRIC LIGHT NOTES.

The Sperry Electric Light, Motor and Car-Brake Company is establishing large works in Chicago.

The Edison Light Company of Milwaukee has been incorporated, with a capital stock of $200,000.

The Bernstein Electric Light Company of Eastern New Hampshire, was organized at Farmington, Saturday, with a capital of $100,000.

The Thomson-Houston system of electric lights is being introduced into Utica, fifty-four lights having been subscribed for by merchants.

The New York State Senate has passed to its third reading the bill compelling all telegraph, telephone and electric light wires to be put underground.

The City Council of Dayton, O., adopted, Feb. 23. a resolution accepting the proposition of the Fuller Electric Light Co. to light the city for one year.

The streets of Seabright, N. J., and the ocean boulevard are hereafter to be lighted by electricity at the expense of the wealthy cottagers and hotel people.

The Arnoux Electric Light Company has received an order to furnish light for the United States and Canadian departments at the Fisheries Exhibition to be held in London.

The telephones in the fire engine houses in Newark were burnt out Sunday night, by contact of the Fire Department wire with an electric light wire. The woodwork in the office of the Superintendent of Fire alarms was set fire to.

A recent conference was held in Boston between many prominent men of that city and the officers of the Edison Electric Light Company of this city, to consider the project of establishing an Edison plant in Boston like that in operation here.

The Edison Company have received permission from the Commissioners of Sewers to continue the lighting of Holborn viaduct by their system for one year, from the 24th ult. The Edison light is to be placed in the corridors and passages of the House of Commons.

All the wires of the Mutual Union Telegraph Company, in Chicago, were cut by order of the Mayor, March 2, because the provision of the franchise which required the company to put its wires under ground by March 1 had not been complied with. The wires of the Board of Trade Telegraph Company were also cut.

Certificates of incorporation of the following companies have been filed with the Secretary of New York State: The Electrical Accumulator Company, to manufacture and deal in all kinds of electrical apparatus, capital stock $50 000; the Overland Telephone Company, capital $1,000,000, with power to be increased to $10,000,000; and the Sun-light Company, for lighting by electricity and transmission of electric power, capital stock $5,000,000.

Meter-ites.

The gas-works of the Town of Lake, Ill. (a suburb of Chicago) were burnt Feb. 24. Loss about $30,000. Insurance $10,000.

Articles of incorporation have been filed for the Perry (N. Y.) Oil and Gas Company, with a capital of $40,000. The object of the company is to bore for oil and gas, also for salt, if it can be found.

An "Associated Press" dispatch from Eastport, Me., states that a gas explosion was caused there by an attempt to thaw the ground by a fire in order to reach a leaking gas main. Twenty feet of the street was torn up, and the corner of a gas reservoir near by torn off.

Food and Drugs.

ADULTERATION OF TEAS.

An "old tea dealer," writing to the *American Grocer*, condemns most emphatically the sale of adulterated teas in this country. The recent action of Congress in regard to our tea supply has made most readers familiar with the fact that this country is a sort of "catch-all" for the larger part of the inferior and adulterated teas which are excluded from other markets.

The adulteration of tea with foreign leaves, exhausted tea leaves, mineral matter, etc., are frauds which no honest person would attempt to defend. Unfortunately, the coloring or "facing" of the leaves is a practice not so generally condemned as it should be, although it must be clear to all that the real intention of the practice is fraudulent, namely, to make the tea appear better than it really is. The coloring of tea is not confined to China and Japan, but is carried on in this country also. If a green tea should be imported in its natural condition the chances are all in favor of its being colored here before it reaches the consumer.

The writer in the *Grocer* raises the question as to "what tea is to be the future drink of the people of this country." He says: "Their preference for greens and oolongs is most pronounced, but is not this because they have not had the choice of acquiring a taste for either congous or dudion teas? There is less chance of adulteration in these, or, if they were adulterated, it would be more easily discernible than in the case of either greens, capers, pekoes, or oolongs, and for this reason it is a pity that they are not brought into greater consumption. They are more wholesome and economical than the others, and when once the flavor is acquired, much more pleasant to the palate."

BROOKLYN WELLS.

Health Commissioner Raymond of Brooklyn continues to wage war against the public wells in the streets of that city. We are pleased to note that he has the support of Mayor Low in this effort, if not that of the Common Council. The latter body recently passed a resolution directing the "repair" of a pump, the water from which had been shown by analysis to be unfit for drinking. This the Mayor returned without his approval, at the same time calling the attention of the Council to the long list of pumps condemned by the Health Department, and now awaiting their action, saying: "It seems to me to be a very grave and serious responsibility to maintain in the midst of our community wells the water of which is certified to be a source of disease."

The following is one of the most recent reports of Dr. Bartley, chemist to the Health Department. The wells are the worst yet examined.

BOARD OF HEALTH,
BROOKLYN *Feb.* 24, 1883.

DR. J. H. RAYMOND, *Commissioner:*

I have, at your request, made an examination of the water from the following wells; viz.: One situated on Maujer street between Waterbury and Morgan streets, and one situated at the corner of Tenth and South Third streets, E. D.

Both of these should be classed as dirty water; both being turbid, and containing very marked evidences of organic pollution The first one mentioned was exceedingly foul and offensive, and contained so much free and albuminoid ammonia that it was difficult to estimate them accurately by the usual process. The nitrites were abundant; and the chlorine was 7. grains per gallon. This well was visited on two occasions about a week apart and the water was found to be very putrid in both instances.

That this well is contaminated by sewage seems beyond a doubt. The large amount of chlorine present in the water points to sewage or animal refuse.

The average amount of chlorine in London sewage according to the Rivers Pollution Commission is eight grains per gallon; and the minimum anount is 4.55 grains per gallon. As will be seen, the chlorine in the water, which is largely of animal origin, is nearly as great as that in average London sewage. This is the worst water yet examined. No one could think of using the water in its present condition, any more than they could use sewage.

The second one mentioned, gave the following results: Free ammonia, 18 per million, and albuminoid ammonia, 20 parts per million. The chlorine in this one was low as compared with the well waters throughout the city, being only 2.2 grains per gallon. Nitrites were present in considerable quantities. The large amount of ammonia, both free and albuminoid, places this among the class of bad waters, and condemns it above all question.

Very respectfully, E. H. BARTLEY.

SEVERAL HEALTH BOARD REPORTS.

FOURTH ANNUAL REPORT OF THE STATE BOARD OF HEALTH OF KENTUCKY 1882. XLIV. 109 pp., 8vo.

We had heard nothing from, or of, the State Board of Health of Kentucky for a year or more, until this report came to hand, hence we opened it with no little curiosity and laid it down with a corresponding disappointment. Whatever the board may have been doing there is no record in this report of anything that it has accomplished, or that it desires to accomplish.

Its 109 pages are devoted to what is called a registration report, the statistics of which, as Dr. J. W. Holland, a member of the board, remarks, are of no value and any deductions from them would most likely be misleading. Dr. Holland's paper on the registration of vital statistics points out briefly and clearly that the physician is a necessary part of the machinery for obtaining vital statistics and that, therefore, the State should require "that the licensed doctor shall have enough technical knowledge to establish the presumption that his opinion of the cause of death will be so near the truth as to be available for practical purposes." Some amusing illustrations of ignorance, as shown by reports of causes of death, are given—such as "falling of the brain;" and "delicacy."

The total expenses of the board were $2,292.08 and it had a balance at the end of the year of $1,007.98 as against a balance the year prveious of $460.28; but while this economy is in one sense praiseworthy, it shows that there was very little desire on the part of the Board to do anything.

The Louisville *Medical News* in a recent editorial upon this board, apparently written by some one who knew what he was talking about, says "two members of the board never attend its sessions and take no interest whatever in its work * * * It is the perpetual cry that nothing can be done unless a larger appropriation is made for the work of the board. Every physician knows the present appropriation is altogether too meager for the work assigned an efficient State Board of Health. For the work of the Board as now conducted, however, the appropriation is ample, and more than ample. There is nothing practical in the little work which is now conducted Public confidence and professional coöperation are most needed by the board. After this will come increased appropriation; but when so little is given in return for the annual expenditure of public money as now obtains, it is useless to expect further aid. Indeed, if the existing condition of affairs is continued, we doubt if the next General Assembly will make any provision whatever for the preservation of the public health."

There may be some personal difficulties in connection with some member of the board which we know nothing about, but at all events, so far as we can gather from this report, the strictures of the editor are justified.

This board has been in existance four years, and by this time ought to have some definite plans and to be able to furnish some definite information. It is to be hoped that it will soon give both to the public.

THIRTY-SEVENTH ANNUAL REPORT OF THE BOARD OF SUPERVISION FOR THE RELIEF OF THE POOR, AND OF PUBLIC HEALTH IN SCOTLAND. 1881-82: Edinburgh, 1882: XXVII, 338 pp. 8 vo.

The greater part of this blue-book relates, as usual, to the work of the Board under the Poor Law, but there are some items relating to public health matters which are of interest. Since 1875 the Board has received from local authorities 180 applications of its approval of loans for raising funds for sanitary purposes. The aggregate amount of these proposed loans is £1,101,745, 11*s.* 11*d.* The total amount of loans recommended by the Board has been £1,049,088, of which £741,341 were for the execution of water works, £139,877 for sewage and drainage works, and £115,450 for the erection of hospitals. This system of requiring a central authority in case a local authority desires to borrow money to construct water works, sewerage, etc., seems to work well, as it ensures the careful preparation of plans and estimates for such works, and that these are subjected to the criticism of competent engineers before the required permission is granted.

The total expenditures of local authorities during the year for sanitary purposes, amounted to £287,992, 15*s.* 8*d.* but this does not include operations carried on under the General or Local Police Acts. The greater part of the space in the appendix which relates to public health, is taken up by reports upon the Notification of Infectious Diseases by the Medical Officers of Health of Edinburgh and Greenock—Drs. Littlejohn and Wallace, these places having been selected for reports, because in the former, the duty of notifying to the local authority cases of infectious disease, is laid by the law on the medical attendant of the patient, whereas, in the latter, the duty rests on the householder. The reports are too long to quote and cannot conveniently be summarized, but both Dr. Littlejohn and Dr. Wallace are strongly of the opinion that the duty of notification should be made compulsory on the physician. Dr. Wallace reports that good results have been obtained by the law exacting reports from householders, but not so good as could be had by the other plan. Both of them agree that to obtain success, it is necessary that the medical officer of health should not be a practising physician. Dr. Littlejohn claims that the system has been put to a crucial test in Edinburgh, and has been a great success, and that "the medical men of the city now unanimously approve of it." This statement is certainly erroneous, for we know that some of the medical men strongly disapprove of it, and this dissatisfaction has been increased by some recent prosecutions in that city—but the argument of Dr. Littlejohn is, nevertheless, a very strong one, and, as such, we commend it to those who are interested in this subject.

The annual reports of the Registrar of Vital Statistics, Board of Health, and City Physician, of Concord, N. H., for the year 1882, are contained in a pamphlet of 14 pages, which we have received. We learn from this that the number of deaths in Concord during the year was 216, being less than for the preceding year, when they were 240, and giving for the estimated population of 14,000 a death rate of 15.44 per thousand. This is certainly low, but the system of registration is based on burial permits and seems satisfactory; in fact, the Board say, "we believe no other city in New England can show equally accurate tables of vital statistics." 38 of the deaths, or about 16.6 per cent. of the whole, were caused by consumption, eight by typhoid fever, and 19 by other zymotic diseases. The number of births for the year was 272.

The report of the City Physician, Dr. George Cook, is very brief, but he makes the remarkable statement that "I am safe in saying that there is a population of 12,000 in that part of the city that would come to me in case medical assistance was furnished by the city." If 85 per cent. of the inhabitants of Concord would take gratuitous attendance from the City Physician if they could get it, they must be either very poor or astonishingly harmonious in their views as to the merits of the physician himself. No definite information is given as to the sewers, it is simply said that there is a very complete and well-ordered system.

No financial statement is furnished, an omission which should never be made in reports of this kind. The Board practically does nothing except upon complaint; it has no inspector, and very possibly has no finances to report about, but if this is so, the fact should be stated.

As regards water supply, the Board say, "we have as pure a supply as any city in New England." They then say that the preservation of the purity of this supply requires care, but they give no hint that it is being made impure, and make no recommendations But when we refer to the report of the State Board of Health we find that the water supply of Concord is from a small lake which is already seriously polluted by garbage, etc, and will be still more so. It seems to us that the Board of Health of Concord should have something to say in this matter.

BOOKS RECEIVED.

FOURTH ANNUAL REPORT OF THE STATE BOARD OF HEALTH, LUNACY AND CHARITY, OF MASSACHUSETTS.

FOREST PROTECTION AND THE TARRIFF ON LUMBER. New York, 1883.

ELEVENTH REPORT OF THE BOARD OF TRUSTEES OF THE ILLINOIS INDUSTRIAL UNIVERSITY, for the two years ending Sept. 30, 1882.

A member of the Philadelphia Board of Health, wants the office of the board put in communication with the general telephone system, and kept open for answers until four P. M.

The *Thonindustrie Zeitung* says that the cement and concrete in the sewers at Frankfort and Hamburg are as good as when laid down four years ago, and become harder by age.

PHILADELPHIA SEWERAGE.

The Committee of Physicians and Citizens of the general Committee of Twenty-one, interested in the sanitary condition of the city, met this afternoon at the rooms of the Committee of One Hundred. The recommendation of the plumbing part of the Committee of Twenty-One, that every man be required to connect his house with the street sewer, was discussed, but the Committee voted that it deemed it inexpedient at the present time, owing to the bad system of sewerage now in vogue, and the great expense that would be attached in such an undertaking, to compel citizens to make said connections. The committee suggested that a sanitary engineer be employed by the city, whose sole duties would be to effect a better condition of sewerage, and see that it was kept in proper order at all times.—*Philadelphia Chronicle Herald, Feb.* 15.

Philadelphia is indeed badly off. Their cesspools are vile and should be abandoned, yet it seems that many of the public sewers are cesspools on a large scale. On this account we presume the committee of physicians and citizens advise against a change that would entail some expense, and, as they believe under the circumstances, secure no adequate advantage, we are of the opinion that where the sewers are in reasonably good condition house owners should be compelled to connect with them, and clean out and fill up their cesspools. Such other sections of sewers as require it should at once be put in proper order under the direction of a competent engineer backed by an influential committee, and as rapidly as this is done householders, should be compelled to drain into them.

YONKERS SEWERAGE.

The Report of the New York State Board of Health relating to the nuisance created by the foul condition of the Nepperhan river at Yonkers, which was submitted to Governor Cornell on September 8, 1882, but has not been acted upon, either by him or by Governor Cleveland, has been transmitted to the Yonkers Board of Health. The report is clearly and concisely condemnatory of the horrible state of affairs they found to exist, and which is fully explained in the report of the engineer, Mr. J. J. R. Croes C.E., who was engaged by the Board to assist them in their examinations, and whose recommendations as to the best mode of abatement of the nuisance are endorsed emphatically by the Board.

The Yonkers Board of Health has transmitted these reports to the common council with the extraordinary recommendation that the question of how the nuisance shall be abated be submitted to popular vote at the coming charter election.

The reason which is assigned by the local board for this shirking of responsibility savors strongly of demagogism. It is thus formulated:

"WHEREAS, There is a difference of opinion as to the best means of abating the nuisance; and

"WHEREAS, This board recognizes and respects the voice and choice of the people in deciding for themselves as to which of the two plans submitted for the abatement of the Nepperhan river nuisance they will adopt; therefore be it

"*Resolved*, That the Honorable the Mayor and the Common Council be requested to take such steps as may seem necessary to give the voters of this city an opportunity to express their wishes, through the ballot box, at the approaching spring election, as to the best mode of abating this great nuisance."

The "two plans" referred to are, first, the arching over of the river for its whole length through the city, and making it a vast sewer; and second, the conveyance of sewage by lateral sewers in the adjacent streets and leaving the stream open and unpolluted. The latter plan is the one recommended by the State Board, by the Water Commissioners and by every engineer who has examined the subject. The first plan has been condemned by every expert who has been called on to report on the subject. Its chief advocate is the Health Officer of the city, who ignores the scientific, the sanitary, and the economic objections to the scheme, and takes his stand merely on his opinion unsupported by argument or fact, that the stream out to be made the sewer. The Mayor of the city, who is also a practicing physician, and surgeon to the police board, has in this case joined with him in advocating the submission of a question of engineering to a popular vote.

It may fairly be asked if these gentlemen would think it judicious to call on the voters of Yonkers to decide by ballot whether vaccination was advisable in case of an epidemic of small-pox, or whether the cure of diseases in the city should be confined to the homœopathic or allopathic physicians, or how certain law suits against the city should be defended.

None of these are questions to be settled by the *vox populi*, and the suggestion of an appeal to that tribunal in this instance, seems to indicate that what was intimated by one of the gentlemen who appeared before the State Board in August, must be true, namely, that some local political questions enter into the matter, and that certain officers of the city are afraid to do their duty, and want to shift the responsibility of their dereliction to the shoulders of the people.

The reasons why the Health Officer's plan should not be adopted, are plainly given in Mr. Croes' report, and they have never been controverted.

The Yonkers Common Council on receipt of the reports and recommendations of the local Health Board, referred the matter to a committee, opinion being apparently divided in the Council, the members who were not afraid of assuming responsibility taking the ground that there was neither authority nor reason in attempting to shift their responsibility to the shoulders of anonymous voters, who would not be so well informed as the Council, and who might not have any direct interest in the proper solution of the problem. It is a good sign that the two newspapers of the city take the same ground, and condemn the shuffling policy of taking a popular vote.

Construction Notes.

WAKEFIELD, MASS.—The Quannapowitt Water Company has awarded the contract for furnishing and laying cement-lined iron pipes for street mains to Messrs. Goodhue & Birnie of Springfield. The pipes will be laid in the spring.

PHILADELPHIA.—The report of the Board of Experts appointed to consider the best means of securing an adequate water supply for Philadelphia was presented at a recent special meeting of the joint committees of finance and water of the City Councils. The experts, consisting of Messrs. E. V. Chesebrough, J. Vaughan Merrick and Frederick Graff, reported the following named machinery and appliances as being, in their opinion, imperatively needed for a supply during the coming summer. At the Schuylkill works—two fifteen million gallon engines, two forcing mains, boiler and engine house, etc., and the completion of the 48-inch main partly laid; total cost, $250,000. At the Roxborough Works—one seven and a half million gallon engine, etc., cost $60,000. Distributing main to supply Germantown from Mount Airy reservoir to Manheim street, on Green street, cost, $70,000, and at Frankford works a ten million gallon engine and connections, to cost $45,000. They further recommend the early completion of the East Park reservoir entire, with connecting, forcing and distributing mains, the building of a reservoir at Cambria and Thirtieth streets, and an addition to the works at Mount Airy. The total cost of the work estimated at $2,267,200, of which amount they recommend the expenditure of $372,500 for finishing the small basin and work on others at the East Park reservior, $200,000 for purchase of land and work on the Cambria street reservoir, and $75,000 for cost of land and work at Mount Airy. The total amount recommended to be expended this year is $1,072,500, while the total amount at the disposal of Councils from any source for the purpose is only about $500,000.

NEW YORK CITY.—The following lowest bids were opened at the headquarters of the Fire Department on the 28th ult.:

For four steam fire engines, the Clapp & Jones Manufacturing Co., $15,200.

For four engines of another pattern, the Ahrens Manufacturing Co., $15,900.

For 15,000 feet of 2½-inch seamless patent improved carbolized steam fire engine rubber-lined hose, made of best Gulf cotton and best Para rubber in lengths of 50 feet, with standard couplings attached, Gutta Percha Manufacturing Co, $15,750.

For eight 4-wheel hose tenders, John N. Bouschelle, $6,565.

Lynn, Mass., is discussing the question of an additional water supply. Mr. Rowell, of the Water Board, favors the construction of a series of filtering galleries along the bank of the Saugus River. Immediate action is said to be necessary as the pond supply is lower than ever before.

A bill has been introduced in the New York State Legislature authorizing the Highland trans-Hudson railroad to construct a bridge across the Hudson River between Storm King and Break Neck Mountains, at any point within five miles north of said mountains, to be built at least fourteen feet above high water. The pier shall be placed 500 feet from each other. The State Engineer shall fix the place of the construction of the proposed bridge.

The Amsterdam (N. Y.) water works are to be completed, at a total bonded cost to the village of $257,000.

Certificate of incorporation of the Carthage Company for supplying water, for mining, domestic and manufacturing purposes, the acquisition and development of lands and water, manufacture of lumber, wood pulp, etc., has been filed at Albany. Capital $100,000.

Bids for Dredging on the Middle Neebish, St. Mary's River, Michigan, received by Maj. F. U. Farquhar, Corps of Engineers, U. S. A., on February 28, 1883, in accordance with advertisement dated January 30, 1883.

PHILADELPHIA SEWER BIDS.

The Highway Committee opened proposals for constructing the following sewers and awarded their contracts to the lowest bidders: for branch sewer on 18th street from the sewer in Green street northward 106 feet to W. B. M. Conklin, at 1.97 per foot and $25 per man-hole, the highest bidder being W. L. McGlue at $3.45 per foot and $25 per man-hole.

Branch sewer on 47th street from the sewer in Westminster avenue to Wyalusing street, to G. H. Miller, at $2.10 per foot and $25 per man-hole, the highest bidder being W. Armstrong, at $4.20 per foot and $28 per man-hole.

Branch sewer on 11th street, from Somerville street to Somerset street and thence to Warnock street, to Bonner & Haley, at $2.10 per foot and $25 per man-hole, the highest bidder S. Cox, at $3.00 per foot and $25 per man-hole.

Branch sewer on 30th street, Susquehanna avenue to Ridge avenue, and thence to 29th street, to Bonner & Haley, at $2.30 per foot and $21 per man-hole; highest W. Armstrong, at $3.35 per foot and $25 per man-hole.

Digitized by Google

Branch sewer on 27th street from Parish street to north line of Cambridge street, to Joseph Murray, at $3.85 per foot and $25 per man-hole; highest, W. L. McGlue, at $4,98 per foot and $25 per man-hole.

HOW DENVER, COLORADO, GOT HER SEWAGE SYSTEM.

CHICAGO, ILL., *Feb.* 1, 1883.

To the Editor of THE SANITARY ENGINEER:

The following may not be news to you, as you apparently have a faculty for finding what corporations are about, and their motives for what they do, whether or not they feel disposed to give the information you seek, but Denver is far from New York, and the people there are all looking for "*traces of mineral,*" and can see nothing unless it has a shine to it (smells having no value whatever), with a prospect of a monopoly, big or small, whereby they will "make their strike" and sell out, or "stock the mine" and go east. But in that land of "mineral," where even the patient Chinaman can buy a pair of rubber boots and a frying pan and go into the south Fork of the Platte and wash five dollars' worth of gold, when it is not too cold, there was one man who had a monopoly so gigantic that he made even the bonanza kings "squeal." Was it a prior claim on Capital Hill with the vein running through the centre of the city? Was it gold or was it silver? No! it was an odorless excavating machine, and he charged $5 per load for removing the contents of the cesspools and discharging it in the Platte. The cry amongst the hotels and large buildings was, "No monopoly! We must have a sewer! Five dollars a load! Robbery!" "But we would not care," says the leading hotel man, "only we have wash basins in every room and self-closing faucets which these deuced assemblymen and senators don't know how to close, and when one comes in slightly 'under the weather' from the effects of the light atmosphere we have up here, he will ruin five dollars worth at 'a lick'—just what we charge him for the day's board. So you see it behooves us to be economical."

So the leading hotel man goes to all the other hotel men with a petition, asking for a sewer to empty into the Platte to break up this monstrous monopoly. They all sign but *one* and are almost happy, but it takes time, even to build a sewer, not to take into consideration the enormous amount of time it takes to get a measure through the gauntlet of municipal *pros* and *cons*. Now, what do you suppose this ungrateful monopolist did when he found his career so near an end. Why he actually raised the price to $10 per load on the hotel that took the initiative, and lowered it to $2 for the hotel keeper who did not sign.

Thus Denver became a sewered city and a model for the other cities of the plains (*on the railroad maps*), because *the grasping cupidity of one man would not let him take cesspool trash to the river at* $1 *per load.*

Yours, etc., F.

The recent school calamity in this city has induced Building Inspector Esterbrook to issue the following order. A similar record obtained in other cities would be desirable:

"You are hereby directed to report to this office a diagram of the floors, showing the position and size of all doors, windows, stairs and all means of egress, of all school buildings in your respective districts, to enable the Inspector of Buildings to determine what additional means of egress are necessary. You are not to neglect your other duties, but by a wise arrangement of your daily plans you can do a great deal toward preventing a like calamity to that which occurred a few days ago. In short, this duty must be done. You will be required to continue within your respective districts, attending to your respective duties, until six o'clock P.M., on every working day except Saturday, and on that day you are to remain at your posts until four o'clock P.M. On the application of any examiner in whose district there are many schools, examiners from other districts will be assigned to assist in order to equalize the amount of work required to be done by each examiner."

IMPORTATION OF INFERIOR TEAS.

The bill to prevent the importation of inferior teas, which we noticed in our issue of Jan. 18, has passed both houses of Congress.

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

Patents.

[*It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, and Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.*]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

266,208. TRAP AND OVERFLOW STOP FOR WASH BASINS, etc. WILLIAM D. SCHUYLER, New York, N. Y. Filed March 1, 1882. (No model.) Issued Oct. 17, 1882.

Claim.—1. A vertical rod movable downwardly by a weight and having a stop, *f*, in combination with faucets B, having each an extension, *b*, whereby the faucets will be worked automatically, as described.

2. The waste-pipe valve C, carrying a pulley, *d*, in combination with the weighted cord *c*, attached to a rod raised by the opening of the supply-valves or faucets, whereby the supply and waste pipe valves will open and close simultaneously, as described.

3. The operating-levers of either faucet B, constructed with an extension, b^1, combined and arranged for operation with the self-closing waste-pipe valve C through a loose connection, E c^1, and stop *f*, substantially as described, whereby an adequate opening of the waste pipe valve is insured, as set forth.

266,216. WATER CLOSET CISTERN. SAMUEL F. SNIFFEN, New York, N. Y., assignor to Henry C. Meyer & Co., same place. Filed May 26, 1882. (No model.) Issued Oct. 17, 1882.

Claim.—In a cistern provided with a supply cock, the combination, with the chain lever, the float lever, and the discharge valve, of the looped rods or straps *m* and *i*, whereby the supply cock is held closed whenever the discharge valve shall be opened.

266,278 WATER-METER. JOHANN C. DENNERT and GEORGE G. LIND, Altona, Prussia Germany. Filed Sept. 8, 1881. (No model.) Patented in Germany Dec. 15, 1881, No. 15,285; in England May 30, 1881, No. 2,367, and in Austria-Hungary July 2, 1881, No. 21,554 and No. 38,102. Issued October 24, 1882.

Claim.—1. In water-meters, the combination of the loose piston *b* with the movable hollow piston-rod *a*, inclosing the spring-rod *o*, and the springs *i* and i^1, which parts cause the sudden working of the reversing mechanism, substantially as described.

2. In water meters or motors, the combination of the piston *b* with the piston-rod *a*, the spring-rod *o*, the springs *i* and i^1, the projections *d* and d^1, and the collars *g* and g^1, substantially as set forth.

3. In water meters or motors, the combination of the hollow piston-rod *a*, the annular projections *d* d^1, and the collars *g* g^1 with the spring-operated rod *o*, the springs *i* and i^1, the arms *p* p^1, with pins *f* and f^1, the latches *e* e^1, and inclines *n* n^1, substantially as set forth.

266,309. WATER-CLOSET. CHARLES F. PIKE, Philadelphia, Pa., assignor, by mesne assignments, to the National Anti-Sewer Gas Company, of New Jersey. Filed April 12, 1881. Renewed March 23, 1882. (Model.) Issued October 24, 1882.

Brief.—On raising lid E seat D is raised high enough to allow cover B, which rests in a sealing-trough on the rim of bowl A, to be turned down on one side, when the seat resumes its position. On closing lid E the operation is reversed, and the bowl, when not open for use, is always trapped.

Claim.—1. In a water-closet, the combination of bowl A, having sealing-trough *a* and cap B, the seat D and seat-lid E, hinged to casing C and connected to each other, and mechanism interposed between said cap seat and seat lid, adapted to be operated by the movement of said lid, to effect the removal and replacement of said cap from and to said bowl, said seat being partially lifted and returned to its normal position during each such movement of said cap.

2. A water closet provided with a bowl having a sealing-trough and cap, a seat and seat-lid, and mechanism interposed between said cap seat and seat-lid, whereby when the lid is raised or lowered said cap will be moved off from and onto said bowl, and the seat raised and lowered during each such movement of the cap, substantially as set forth.

3. The combination, with a water-closet bowl having a trough surrounding its upper edge, of a cap or valve adapted to seat in said trough, a seat and seat-lid for such bowl, and mechanism interposed between said cap seat-lid and seat, whereby when the seat lid is raised or lowered said cap will be oscillated off from and onto said bowl, and said seat will, during such movement of the cap, be partially raised and then returned to its normal position, substantially as set forth.

4. In a water-closet the combination of a bowl formed with a trough on or around its upper edge, adapted to hold mercury or packing to form a seal, a valve or cap therefor, a seat, seat-lid and mechanism interposed between said cap seat and seat-lid, constructed substantially as shown and described, and adapted to oscillate said cap off from and lower it down alongside of said bowl beneath the casing, said seat rising during such oscillation to permit such movement of said cap, and returning to its normal position when the said movement of the cap is completed.

5. The combination of a water-closet bowl A, having trough *a*, cap B, the movable seat D, lid E, and mechanism interposed between said cap, seat, and seat-lid, substantially as shown and described.

6. The combination, with bowl A, of a hinged seat, D, and seat-lid E, connected to each other by link mechanism F, whereby when said seat-lid is lifted or lowered said seat will be partially raised and returned to its normal position, substantially as shown and for the purpose set forth.

7. The combination, with bowl A, having trough *a*, and cap B, of a movable seat, D, and seat-lid E, levers G H, links *g* *h*, bar I, having stud *i*, and connected to cap B, and slotted bracket K, said parts being arranged substantially as shown and described.

8. A water-closet bowl provided with a projecting conduit, to which is secured a valve *l*, substantially as shown and described, whereby any leakage or drip from said valve will pass into said conduit and then be conducted into said bowl, substantially as set forth.

9. The combination of bowl A, having trough *a*, cap B, and water-cock *l*, the seat D and lid B, bar I, having finger I^1 weighted tripping-lever N, and mechanism interposed between said lid and bar, said parts being arranged substantially as shown and described, and for the purpose set forth.

266,404. WATER CLOSET AND URINAL. GEO. E. WARING, JR., Newport, R. I., assignor to the Drainage Construction Co., Boston, Mass. Filed Jan. 20, 1882. (No model.) Issued Oct. 24, 1882.

Claim.—1. A water closet or urinal of which the contents are discharged by the action of a valveless siphon having a depth of seal or dip greater than the greatest diameter of the siphon.

2. In combination with the bowl of a water closet or urinal whose contents are discharged by the action or a valveless siphon, a siphon which is of uniform diameter throughout its length, substantially as shown.

3. In combination with the bowl of a water closet or urinal, a discharging siphon the mouth of whose discharging limb delivers to the weir chamber or a false trap or other form of obstruction so constructed that when the outflow of the siphon is greater than the capacity of the free space between the mouth of the siphon and the bottom of the overflow of the weir chamber or false trap, or between the mouth of the siphon and the obstruction, the mouth of the siphon becomes sealed or closed against the admission of air, substantially as set forth.

4. In combination with the bowl of a water closet or urinal and a siphon by which the same is discharged, a weir chamber or false trap so constructed that the water discharged into it wells up, so as to seal or close the mouth of the outlet at the beginning of the flow, and from which a portion of the water remaining at the end of the flow is discharged, so as to unseal or open the mouth of the outlet, substantially as set forth.

5. In combination with the bowl of a water closet or urinal and a siphon for discharging its contents, a weir chamber or false trap or other obstruction so constructed that the mouth of the siphon is sealed at the beginning of the flow and is unsealed after the flow ceases, substantially as set forth.

6. A water closet or urinal of which the contents are discharged by the action of a valveless siphon so construced that the mouth of the receiving limb of the siphon is not opened for the admission of air until after the water in the bowl is lowered to less than one-half its normal depth, substantially as set forth.

266,416. PNEUMATIC APPARATUS FOR REMOVING NIGHT SOIL FROM CESSPOOLS. JEAN BAPTISTE BERLIER, Paris, France, assignor to the Compagnie Générale de Salubrité, same place. Filed Jan. 12, 1882. (No model.) Patented in France Mar. 14, 1881, No. 141,763. Issued Oct. 24, 1882.

Claim.—1. The pneumatic tube G, combined with purge-pipe A, cock *a*, supply pipe B, and with apparatus, substantially as described, for creating suction in pipe G, as and for the purpose specified.

2. The strainer D, combined with pipes *i j* and gratings *l* and with the pneumatic tube G and pipe B, with which it communicates, substantially as specified.

3. The valve-box C, combined with the valve *c d*, mouth piece *f*, and with the pneumatic tube G and pipe B, with which it communicates, substantially as herein shown and described.

4. The combination of the pipe E, strainer D, valve-box C, pipe B, pneumatic pipe G, water supply pipe A, and valve *a* with apparatus, substantially as specified, for creating a vacuum in the pipe G, as set forth.

5. The combination of pipe C^2, having bend b^3, with the pipes F^2 and E^2, for the passage of gases where the pneumatic tube is siphoned in case of any obstruction in the bend of the siphon, as described.

266,146. COMPOUND FOR FURNACE LININGS AND FIREBRICK. JAMES HENDERSON, Bellefonte, Pa., assignor to Charles G. Francklyn, New York, N. Y. Filed Sept. 6, 1882. (No Specimens.) Issued Oct. 17, 1882.

266,161. ELECTRIC ARC LAMP. OTTO KARTZMARK, New York, N. Y. Filed Feb. 14, 1882. (No model.) Issued Oct. 17, 1882.

266,210. SHIELD FOR PROTECTING TAPER-FLAME OF GAS BURNERS. WILSON D. SCHOOLEY, Richmond, Ind. Filed June 17, 1882. (No model.) Issued Oct. 17, 1882.

266,220. STEAM BOILER TUBE. GEORGE S. STRONG, Philadelphia, Pa. Filed March 6, 1882. (No model.) Issued Oct. 17, 1882.

266,232. PUMP. DAVID E. WASHBURN, Houghton, Mich. Filed Feb. 24, 1882. (No model.) Issued Oct. 17, 1882.

266,235. MAGNETO OR DYNAMO ELECTRIC MACHINE. ADDISON G. WATERHOUSE, New York, N. Y., assignor to the United States Electric Lighting Company, same place. Filed May 24, 1882. (No model.) Issued Oct. 17, 1882.

266,236. CARBON HOLDER FOR ARC LAMPS. ADDISON G. WATERHOUSE, New York, N. Y., assignor to the United States Electric Lighting Company, same place. Filed June 2, 1882. (No model.) Issued Oct. 17, 1882.

266,240. ELECTRIC ARC LAMP. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed July 17, 1882. (No model.) Issued Oct. 17, 1882.

266,242. ELECTRIC LAMP. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed May 23, 1882. (No model.) Issued October 17, 1882.

266,267. AIR PURIFIER. PETER BREEN, Cincinnati, Ohio. Filed April 7, 1882. (No model.) Issued October 24, 1882.

266,268. MANUFACTURE OF GLUCOSE FROM CACTUS. WILLIAM B. BRITTINGHAM, New York, N. Y. Filed April 11, 1882. (No specimens.) Issued October 24, 1882.

266,300. APPARATUS FOR THE MANUFACTURE OF SUGAR. JAMES A. MORRELL, New York, N. Y., assignor to the James A. Morrell Evaporator Company, same place. Filed Feb. 21, 1882. (No model.) Issued October 24, 1882.

266,303. APPARATUS FOR CREATING VACUUMS IN INCANDESCENT ELECTRIC-LAMP GLOBES. HANS J. MULLER, New York, N. Y., assignor to himself and Alexander Lovett, same place. Filed April 11, 1882. (No model.) Issued October 24, 1882.

266,304. GAS-ENGINE. PETER MUNZINGER, Philadelphia Pa. Filed March 2, 1882. (No model.) Issued October 24, 1882.

266,353. ELECTRIC CABLE. PATRICK B. DELANY, New York, N. Y. Filed Oct. 31, 1881. (No model.) Issued Oct. 24, 1882.

266,359. HOSE COUPLING. THEODOR GOTZEL, New York, N. Y. Filed June 6, 1882. (No model.) Issued Oct. 24, 1882.

266,369. LIME-HEATING FOOT STOVE. PHILLIP O. JENKINS, Washington, D. C. Filed Oct. 12, 1881. Renewed Oct. 2, 1882. (No model.) Issued Oct. 24, 1882.

266,377. SIPHON PUMP. ALEXANDER MACKELLAR, Brooklyn, N. Y. (John MacKellar, administrator of said MacKellar, deceased.) Filed Jan. 25, 1882. (No model.) Issued Oct. 24, 1882.

266,393. HEATING STOVE. EWALD SCHONEBERG, Bockenheim, Germany, assignor to himself and Otto Cullman, Cullman, Ala. Filed July 15, 1882. (No model.) Patented in England, Feb. 28, 1882, No. 967; in Belgium Mar. 15, 1882, No. 57,216, and in France May 9, 1882, No. 147,640. Issued Oct. 24, 1882.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

For the week ending February 24, of an urban population of 6,604,934, there died 2,761, which is equivalent to an annual death rate of 21.3 per 1,000, a little less than that for the preceding week, which was 21.8.

14.6 per cent. of the total mortality was due to consumption, 11 per cent. to pneumonia, 3 per cent. to diphtheria, 2.7 per cent. to scarlet fever, 1.9 per cent. to small-pox, 1.6 per cent. to typhoid fever, and 1.1 per cent. to whooping cough.

For the North Atlantic cities the death rate was 21.8; for the Eastern cities, 24.4; for the lake cities, 17.1; for the river cities, 17.7, and in the Southern cities, for whites, 19.2, and for the colored, 32.8 per 1,000.

Cincinnati reports a death rate of only 16.7. 40 of the 53 cases of small-pox reported occurred in New Orleans. The death rate in New York City is high, 27 per 1,000; and even higher in Newark, where it is 29.1. In San Francisco the death rate for the preceding week was 17.7, and only 4 deaths are reported as due to consumption.

NEW YORK CITY.—Dr. John T. Nagle reports that the accidents in the table include 16 children killed by suffocation and injuries during a panic in school.

NEW YORK CITY LUNATIC ASYLUM.—Dr. Franklin reports 11 admissions, nine discharges, one death and 1,333 insane patients remaining under treatment.

BOSTON, MASS.—C. E. Davis Jr. reports 40 cases of diphtheria, 24 of scarlet fever and three of typhoid fever.

MILWAUKIE, WIS.—Dr. E. W. Diercks reports 20 new cases of scarlet fever and eight of diphtheria, making 13 of the latter disease and 45 of the former under treatment.

DETROIT, MICH.—Dr. O. W. Wight reports 18 new cases of diphtheria 18 of scarlet fever and one of small-pox.

Digitized by Google

LYNCHBURG, VA.—Since Feb. 12 four cases of small-pox have occurred, one of which proved fatal during the past week.

LOUISVILLE, KY.—Dr. Montgomery reports eight cases of small-pox as having occurred during the week.

The report from Louisville for the week ending Feb. 17 did not arrive in time for entry in our table. There were 72 deaths reported, 14 in persons under five years. Consumption caused 14 deaths, croup one, typhoid fever three, malarial fever two, pneumonia six, congestion of lungs one, small-pox two and whooping cough one, 10 new cases of small-pox were reported during the week.

DAYTON, OHIO.—Dr. E. B. Davis reports the appearance of a case of small-pox in the city.

PITTSBURG, PA.—Dr. Snively reports 10 new cases of small-pox.

WHEELING, WEST VA.—Dr. T. O. Edwards reports that small-pox has entirely disappeared from the city.

MOLINE, ILL.—Dr. L. D. Dunn reports pneumonia as prevailing, four deaths having occurred from this disease out of a total of seven during the week. The small-pox cases have recovered and quarantine has been raised.

ROCK ISLAND, ILL,—Dr. G. G. Craig reports nine deaths for the week; under five years three; one fatal case of cerebro-spinal meningitis is reported.

HUDSON, CO. N. J.—C. J. Rooney's arrived too late for tabulation last week (Feb 17). Total mortality 89 ; under five years 38. Accident one, consumption 16, croup two, diphtheria seven, typhoid fever four, scarlet fever four, pneumonia 11, congestion of lungs one, acute bronchitis six, and measles two deaths.

MASSACHUSETTS.—The weekly returns of vital statistics prepared by Dr. S. W. Abbott of the State Board of Health, Lunacy and Charity show 405 deaths during the week ending Feb. 17, in 41 cities and towns of Massachusetts aggregating a population of 1,309,495. Fifty-eight deaths were recorded from the principal zymotic diseases, diphtheria and croup 24, scarlet fever 11, typhoid fever five, purpual fever five, cerebro-spinal meningitis four, diarrhœal diseases four, whooping cough two, erysipelas two, malarial fever one. Death rates for the week ; Boston 27.37, Lowell 17.47, Worcester 17.84, Cambridge 20.69, Fall River 26.53, Lawrence 19.82, Lynn 19.01, Springfield 10.81, Salem 20.73, New Bedford 19.35, Somerville 22.89, Holyoke 26.17, Chelsea 9.52, Taunton 17.16, Gloucester 13.45, Haverhill 25.25 Brockton 19.11, Newburyport 19.17, Malden 4.33. The total death rate for the week was 16.09 against 21.25 and 20.78 for the previous two weeks.

MICHIGAN.—Dr. H. B. Baker's report for the week ending Feb. 17 shows the prevalence of bronchitis, neuralgia, rheumatism, consumption, intermittent fever, tonsilitis, influenza and pneumonia.

One case of measles was found among immigrants arriving at Port Huron during the week.

BERLIN, GREEN LAKE CO., WIS.—G. J. Thomas, P. M., reports under date of Feb. 21 that small-pox is prevailing in the city to an extent amounting to almost an epidemic. Thirty-three cases have occurred to date, three of which have proved fatal. The city and health officers are using every means to prevent its further spread, but its prevalence among citizens of Polish and German extraction, who are often averse to vaccination, operates greatly against their efforts to suppress the contagion.

READING, PA.—According to the report of Secretary Howell 19 deaths occurred in the city during the week ending Feb. 20 ; males 12, females seven ; under five years nine, over 60 years five. Four deaths were caused by convulsions, two by consumption, two by pneumonia, two by scarlet fever and one by typhus fever.

BALTIMORE, MD.—During the week ending Feb. 24 there were 171 deaths ; males 91, females 80 ; under five years 78, over 60 years 33. The annual rate as caculated by the local authorities is for the whole population 21.74 ; for the white 16.09, for the colored 54.60. Small-pox caused 25 deaths, bronchitis one, pleurisy one, pneumonia 20, congestion of lungs one, consumption 24, croup seven, diphtheria ten, measles one, scarlet fever 11, whooping cough one. No deaths are reported from typhoid fever, diarrhœa, puerperal fever or eryesipelas. Violence caused three deaths.

ONTARIO, CANADA.—The *Provincial Bulletin* for the week ending Feb. 17, states the prevalent diseases to have been bronchitis, neuralgia, influenza and anæmia. Measles, mumps, scarlet fever and diphtheria increased in their area of prevalence during the week.

VERA CRUZ, MEXICO.—During the month of January there were 106 deaths ; males 66, females 40, adults 73, children 33. Yellow fever caused five deaths, malarial fevers eight, dysentery one. No deaths are reported from scarlet fever, typhoid fever, small-pox, measles, whooping cough or diphtheria.

RIO DE JANEIRO, BRAZIL.—Deputy Consul-General Jas. H. Murray sends reports for the weeks ending Jan. 6, 13 and 20. Population 330,000.

Jan. 6. Total mortality 212 ; small-pox caused 21 deaths, pernicious fever five and consumption 42.

Jan. 13. Total mortality 256. Small-pox caused 22 deaths, pernicious fevers eight and consumption 37.

Jan. 20. Total mortality 245. Small-pox caused 26 deaths, pernicious fevers four and consumption 27.

Small-pox and pulmonary affections are reported as the prevailing diseases.

VALPARAISO, CHILI.—Vice Consul August Moller, Jr., reports 587 deaths for the month of Dec., in a poputation of 101,088. Of these 75 were caused by small-pox, 88 by lung diseases, 68 by consumption, and 147 by fevers.

HONOLULU, H. I.—Gonsul D. A. McKinley reports 46 deaths for the month of January ; under five years seven, over sixty years eight; males 32, females 14. Dysentery caused two deaths, bronchitis two, and consumption seven. No deaths are reported from small-pox measles, scarlet fever, etc.

VICTORIA, VANCOUVERS' ISLAND —Consul Allen Francis reports Feb. 10 that small-pox is understood to be prevailing in Washington Territory and on the main land of British Columbia.

ENGLAND AND WALES.—The return of the Registrar-General for the quarter ending Dec. 31, shows the registered deaths to have numbered 133,267 equal to an annual rate of 20.0 per 1,000 of the estimated population 26,406,820. This death rate was 0.9 below the mean rate in the 10 preceeding corresponding quarters, but exceeded by 1.3, the exceptionally low rate in the fourth quarter of 1881.

The 133,267 deaths included 68,393 males and 64,874 females, giving the respective rates of 21.1 and 19.0 per 1,000 estimated to be living of each sex. In equal numbers living, the deaths were 111 of males to 100 of females.

In the urban population, estimated at fifteen and a half millions of people, the death rate was equal to 21.7 per 1,000, while in the remaining and chiefly rural population estimated at about ten and a half millions, the rate did not exceed 17.5. In equal numbers living the deaths were 124 in the urban to 100 in the rural population as compared with an average of 128 to 100 in the corresponding quarters of the preceeding 10 years. The death rate in the 28 great towns was 1.2 above the general urban rate. It did not exceed 21.8 in London, whereas it averaged 23.9 in the 27 provincial towns.

Among the deaths were 31,460 of infants under one year of age, 66,618 of children and adults between one and 60 years, and 35,189 of persons over 60.

Scarlet fever caused 4,053 deaths, or 0,61 per 1,000 (annual rate against an average of 0,92 in the corresponding quarters of the 10 preceeding years. Diarrhœa caused 2,814 deaths, equal to an annual rate of 0.41 as compared with the average, before mentioned, of 0.54. Measles caused 2,774 deaths, rate 0.42, average 0.37 ; fevers, including typhus, typhoid, and continued, 2,525, rate 0.38, average 0.51 ; whooping cough, 2,431, rate 0.37, average 0.38 ; diphtheria, 1,002, rate 0.15, average 0.13 ; small-pox 190.

There were 217,591 births registered giving an annual rate of 32.7. This rate is lower than that recorded in the fourth quarter of any year since 1861, excepting only 1880, when the rate was but 32.1. In the 28 great towns the birth rate averaged 34.8, and was 2.1 above the general English rate. The London rate was 34.2 and the average of the 27 provincial towns 35.3.

During the week ending Feb. 10, the mortality in the 28 large towns averaged 23.5 per 1,000. Derby registered the lowest rate, 13.4, and) Liverpool the highest 33.3. No death in Norwich was referred to any of the principal symotic diseases.

London.—There were 2,888 births and 1,631 deaths in London during this week ; the former exceeded by 44, whereas the latter were so many as 376 below the average numbers of the corresponding weeks of the past 10 years. The annual rate was 21.5. The deaths included two from small-pox, 29 from measles, 33 from scarlet fever, 14 from diphtheria, 42 from whooping cough, 20 from enteric fever, none from typhus, 14 from diarrhœa and dysentery, 390 from diseases of the respiratory organs, and 64 from violence.

SCOTLAND.—During the week ending Feb. 10 the death rate in the eight principal towns was 28.8 or 4.1 above that for the corresponding week of last year. The lowest mortality was recorded in Perth, 25.5 and the highest in Paisley, 30.8. For an abstract of this return see our table given above.

The return of the Registrar-General for the month of January shows the registration of 3,995 births and 2,989 deaths in the eight principal towns. Of the deaths 1,473 were of males, and 1,516 of females. The mortality was at the annual rate of 22 per 1,000 in Edinburgh, 23 in Leith, 27 in Paisley and Perth, 28 in Aberdeen, 30 in Greenock, 32 in Glasgow, and 34 in Dundee. Forty-two per cent. of the total mortality occurred in children under five years of age. Whooping cough was the most fatal epidemic, having caused 232 deaths ; fever caused 38 deaths, of which 10 were tabulated as typhus ; scarlet fever caused 56 deaths, diarrhœa 47, measles 45, croup 40, diphtheria 37, dysentery six, British cholera one, consumption 279, inflammatory affections of the respiratory organs 763, and violence 72.

IRELAND.—Consul A. B. Wood of Belfast transmits return of Registrar-General for the week ending Feb. 3, a summary of which was included in our table of last week.

Dublin.—Deaths 220 ; rate 32.7. No deaths were caused by small-pox, measles or diphtheria. Whooping cough caused 16 deaths, diseases of respiratory organs 62.

Belfast.—Deaths 130 ; rate 31.6. Scarlet fever caused eight deaths, whooping cough nine, and diseases of the respiratory organs 46.

Consul Wood transmits also the Registrar-General's return for the week ending Feb. 10. For summary see table.

Dublin.—Deaths 246 ; typhus eight, whooping cough 11, enteric fever and diarrhœa six each, consumption 38, diseases of the respiratory organs 73, and violence three. No deaths are reported from small-pox, measles, scarlet fever or diphtheria. Annual rate 36.6.

Belfast.—Deaths 166 ; small-pox two, measles three, scarlet fever nine, typhus none, whooping cough seven, diphtheria one, typhoid fever three, diarrhœa four, consumption 23, diseases of respiratory system 50, and violence five. Annual rate 40.3.

RHEIMS, FRANCE.—Consul John L. Frisbie reports the occurrence of 59 deaths during the week ending Feb. 3; males 35, females 24 : under five years 21, over 60 years 21. Annual rate 32.69. No deaths are reported from measles, scarlet fever, whooping cough, erysipelas or diarrhœa. Croup and diphtheria caused eight of the 59, consumption five, pneumonia three, small-pox one, and typhoid fever two.

BORDEAUX, FRANCE.—Consul G. W. Roosevelt transmits a copy of the monthly bulletin for January. There were 472 deaths excluding 52 still-births, population 221,305. No deaths occurred from small-pox, measles or whooping cough. Scarlet fever caused two deaths, typhoid fever 14, croup ten, puerperal fever two, erysipelas one, consumption 76, acute bronchitis 20, pneumonia and pleurisy 39, diarrhœal diseases three, and violence 13.

LEIPZIG, SAXONY.—Vice-Consul Fred Nachor transmits a copy of the mortality return for 1882. During the year there occurred 3,295 deaths, males 1,827, females 1,468 ; under five years 1,389, over 60 years 519; population 160,296. Small-pox caused two deaths, measles 19, scarlet fever 48, diphtheria and croup 121, whooping cough 57, typhoid fever 33, dysentery six, puerperal fever 36, consumption 606, acute diseases of the respiratory organs 360, and violence 143.

ST. PETERSBURG, RUSSIA.—Consul-General Edgar Stanton reports 743 deaths during the week ending Jan. 27. Of the decedents 370 were under five years of age, and 70 over 60 years ; 386 were males and 357 females, population 929,525. Small-pox caused 17 deaths. On Jan. 28 there remained under treatment in the hospitals 90 cases of small-pox, 1,200 of fever and 1,217 of venereal diseases.

COPENHAGEN, DENMARK.—During the week ending Jan. 23 there were 142 deaths in a population of 258,000; under five years 64, over 60 years 36. Measles, scarlet fever, croup, typhoid and puerperal fever caused one death each, diarrhœa and whooping cough four each, diphtheria three and erysipelas two, consumption 16, bronchitis five, pneumonia 11 and violence four.

Among the cases of contagious and epidemic diseases reported by the physicians during the same week were two of measles, 14 of scarlet fever, 13 of diphtheria, three of croup, 61 of whooping cough, nine of typhoid fever, 91 of diarrhœal disease, 23 of erysipelas, 625 of bronchial catarrh, 47 of pneumonia and 177 of tonsilitis.

COPENHAGEN, DENMARK.—During the week ending January 30 there occurred 132 deaths ; under five years 58, over 60 years 36. Population 258,000. Diphtheria, typhoid and puerperal fevers caused two deaths each, scarlet fever one, whooping cough three, diarrhœal diseases four, consumption 18, bronchitis eight and pneumonia 11. The following cases were reported by the physicians : small-pox none, measles two; scarlet fever 21, diphtheria 16, croup one, whooping cough 66, typhoid fever ten, diarrhœal diseases 87, erysipelas 23, puerperal fever three, bronchial catarrh 799, pneumonia 70 and tonsilitis 152.

ROTTERDAM, NETHERLANDS.—Consul Jno. F. Winter sends reports for the weeks ending Jan. 27 and Feb. 3. During the latter there were 109 deaths in a population of 157,270. Eleven cases of were small-pox are recorded and six deaths from that disease. During the former there were 98 deaths, of which seven were from small-pox. Seventeen cases of this disease are reported.

VIENNA, AUSTRIA.—The report for the week ending Jan. 20 shows the occurrence of 418 deaths in a population of 749,762, equal to an annual rate of 29.0. Of the deaths 143 were in children under five years. Small-pox caused three deaths, measles none, scarlet fever five, diphtheria three, whooping cough and typhoid fever two each, consumption 111, and acute diseases of the respiratory system 82.

Consul-General Weaver's report for the week ending Jan. 27 shows the occurrence of 465 deaths, equal to an annual rate of 32.3. Small-pox caused five deaths, measles nine, scarlet fever two, typhoid fever two, diphtheria three, whooping cough four, consumption 103 and acute lung disease, 89. Of the deaths 180 occurred in children under five years of age.

VIENNA, AUSTRIA.—Consul General Jas. R. Weaver sends report for the week ending Feb. 3, showing 419 deaths, equal to an annual rate of 29.1 ; under five years 157 ; small-pox caused four deaths, measles one, scarlet fever one, diphtheria six, whooping cough five, tyhoid fever four, typhus fever one, consumption 103, and acute lung diseases 85. Mr. Weaver states that during the past month typhus fever introduced by tramps has given the health authorities great concern.

VENICE, ITALY.—Consul W. H. De Wolf Budd transmits report for the week ending Jan. 27. Total deaths 81 ; males 44, females 37, population 139,513. Annual rate 30.2. The city is free from small-pox, measles, scarlet fever, diphtheria, croup and typhoid fever. Lung diseases are the principal causes of death.

WARSAW, RUSSIAN POLAND.—Consul Rawier reports 219 deaths during the week ending Jan. 20, in a population of 383,973. Only one of the deaths was caused by small-pox.

ST. PETERSBURG, RUSSIA.—Consul-Gen. Stanton sends reports for the weeks ending Jan. 6, 13 and 20.

Jan. 6. Total deaths 694 ; males 369, females 325; under five years 307, over 60 years 91. Small-pox caused 25 deaths. On Jan. 7 there remained under treatment in the hospitals 67 cases of small-pox and 957 of fever.

Jan. 13. Deaths 737 ; males 418, females 319; under five years 340, over 60 years 74. Small-pox caused 28 deaths. On Jan. 14 there were 70 cases of small-pox and 1,112 of fever under treatment in the hospitals.

Jan. 20. Deaths 778 ; males 450, females 328; under five years 328 ; over 60 years 91. Small-pox caused 29 deaths. On Jan. 21 there were 80 cases of small-pox and 1,192 of fever under treatment. Population of the city 927,467.

STOCKHOLM, SWEDEN.—Consul Elfwing transmits report for the week ending January 27, showing a total of 117 deaths, males 63, females 54, under five years 53, over 60 years 20. Annual rate 34.9. Measles caused five deaths, scarlet fever three, puerperal fever and whooping cough one each, diphtheria and croup four, typhoid fever three, diarrhœa five, consumption ten, bronchitis 11 and pneumonia 19.

During the week ending February 3 the following cases were reported : measles 68, scarlet fever 29, erysipelas three, whooping cough nine, diphtheria nine, typhoid fever three, diarrhœa and pneumonia 22 of each, bronchitis 119 and tonsilitis 20.

BRUSSELS, BELGIUM.—The bulletin for the week ending February 3 shows 197 deaths in the city and its *faubourgs*, equal to an annual rate of 25.1. Small-pox caused six deaths, measles four, fever one, croup three, whooping cough three, diarrhœal diseases 22, bronchitis and pneumonia 34 and consumption 28.

CALCUTTA, INDIA.—During November there were 1,244 deaths registered giving an annual ratio of 34.4 against 31.8 during the preceding month. The proportion of males to females was as 144 to 100. Cholera prevailed sporadically and with more than its usual severity in the northern sections of the town. It caused 232 deaths against 91

Digitized by Google

in the preceding month. This number exceeds the mean of the corresponding month of the decade by 86. Fevers caused 369 deaths as compared with 312 in the previous month. Bowel complaints 147 as against 150. Mortality from other causes 470 as against 374.

Consul-General Mattson transmits reports for the weeks ending respectively December 30, January 6 and 13.

December 30: Total deaths 334, giving a ratio of 40.2 as compared with 43.2 during the previous week. Cholera is reported as abating but is still considerably in excess of the average. The number of deaths from fevers amounted to 77, from diarrhœal diseases 51, from tetanus 23 and from cholera 79.

January 6: The number of deaths registered was 321 giving a ratio of 38.6. Fevers caused 71 deaths, diarrhœal diseases 46, tetanus 26 and cholera 61.

January 13: Total deaths 303. Annual rate 36.3. Fevers caused 80 deaths, diarrhœal diseases 44, tetanus 21 and cholera 49.

MADRAS, INDIA.—The reports for the three weeks ending December 29, January 5 and 12 have been received.

December 29: Total deaths 257; males 130, females 127; annual rate 33.6. Small-pox caused two deaths, measles none, fevers 87, dysentery 28, diarrhœa 14 and cholera none.

January 5: Total deaths 312; males 159, females 153. Annual rate 40.8. Small-pox caused seven deaths, measles one, fevers 66, dysentery 22, diarrhœa 24 and cholera none.

January 12: Total deaths 285; males 142, females 143. Annual rate 37.3. Small-pox caused four deaths, measles two, fevers 73, dysentery 27, diarrhœa 11 and cholera none.

SINGAPORE, INDIA.—Consul A. G. Studer sends report for the month of December showing 365 deaths in a population of 139,000. Of these 96 were caused by fever, 38 by consumption, 32 by convulsions, 32 by diarrhœa, nine by dysentery, four by small-pox and two by leprosy. The health of the town is considered as satisfactory.

BOMBAY, INDIA.—Consul B. F. Farnham reports for the weeks ending January 16 and 23.

January 16: The number of deaths registered was 467, or nine less than the average of the corresponding periods in the preceding five years. Annual rate 29.86. There were 100 deaths from remittent fever, 62 from diseases of the respiratory system, 29 from diarrhœa and 15 from dysentery. Small-pox caused 33 deaths.

January 23: Total deaths 491 or ten in excess of the mean of the corresponding weeks of the preceding five years. Annual rate 30.12. Remittent fever caused 99 deaths, diseases of the respiratory organs 74, diarrhœa 28, dysentery 11 and small-pox 32.

COLOMBO, CEYLON.—During the week ending January 13 there were 34 cases of small-pox with four deaths, and during the following week ending January 20, 30 cases with two deaths.

SHANGHAI, CHINA.—Vice-Consul-General F. D. Cheshire reports under date of January 9, that there were eight cases (foreigners) of small-pox in hospital and that the disease is prevalent among the natives in one part of the foreign settlement.

During the week ending January 16 one new case of small-pox was reported.

SIDNEY, NEW SOUTH WALES.—Vice-Consul F. H. Boyd transmits the return of the Registrar-General for the month of November. The births numbered 816 and the deaths 394. In the city 178 deaths occurred; males 117, females 61; under five years 84; population 103,379. In the suburbs 216 deaths were registered; males 120, females 96; under five years 131; population 120,832. Diarrhœa was the most fatal zymotic disease, it having caused 17 deaths in the city and 24 in the suburbs. Cholera is reported as having occasioned two deaths in the suburbs.

BRISBANE, NEW SOUTH WALES.—There were 106 deaths registered in the city and suburbs during the month of November; males 64, females 45; under five years 64; population 33,068. Of the 106, zymotic diseases caused 45, but the report does not particularize the diseases.

MELBOURNE, AUSTRALIA.—During the month of November there were 578 deaths in the city and suburbs; males 325, females 253; under five years 285, over 75 years 22; population 284,874. As compared with the previous month a large increase took place in deaths from all classes of disease. Zymotic diseases rose from 42 to 119. Measles caused one death, croup two, whooping cough two, typhoid fever five, erysipelas six, dysentery eight, diarrhœa 71, cholera eight (sic), consumption 55, bronchitis 16, pleurisy eight, pneumonia 26, congestion of the lungs eight and violence 25.

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

ANTICIPATING a large demand for really first-class — LABORATORY PRODUCTS, — which shall meet the strictest requirements of the New Pharmacopœia, we have greatly increased our manufacturing department.

Our laboratory is in charge of a gentleman of recognized prominence in his profession, and with the command of ample facilities, we can offer a line of preparations that can be implicitly relied on as of the proper strength and purity.

W. H. SCHIEFFELIN & CO.

NEW YORK:
170 and 172 William St.

Pure Sugar vs. Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

Reliable Food Products.

As the Largest Manufacturers and Dealers in the world in this line, we prefer, and, indeed, we consider it to our interest to manufacture only PURE and WHOLESOME goods, and pack them in a tidy and attractive manner. *All goods bearing our name are guaranteed to be of superior quality, and dealers are authorized to refund the purchase price in any case where consumers have cause for dissatisfaction.* It is, therefore, to the interest of both dealers and consumers to use THURBERS' BRANDS.

H. K. & F. B. THURBER & CO.

West Broadway, Reade and Hudson Streets, New York.
9 and 11 Fenchurch Avenue, London. E. C., England.
9 Rue Foy, Bordeaux, France.

NOTICE.

Our Canned Goods are put up with a special quality of tin, and most of them, being hermetically sealed while fresh at the sources of supply, preserve the fresh, natural flavors, and are REALLY FRESHER, MORE WHOLESOME AND PALATABLE than many so-called "fresh" articles which are exposed for sale during considerable periods of time in city markets.

THE SIXTH VOLUME OF

THE SANITARY ENGINEER.

The sixth volume of THE SANITARY ENGINEER includes the 27 issues from June 1 to Nov. 30.

The following are a few of the many articles of permanent interest:

Illustrated descriptions of the plumbing work in the well-known residences of Messrs. Wm. K. Vanderbilt, Cornelius Vanderbilt, Ex-Gov. Samuel J. Tilden, John Sloane. Also of the "Mills Building" (the largest office building in New York) and Minot, Hooper & Co.'s Commercial Buildings. A Russian Bath Establishment in Boston and the St. James Hotel in Baltimore.

"Berlin Sewerage." An elaborate report of the system just completed, with illustrations. By M. A. Durand-Claye, Engineer-in-Chief of Bridges and Roads of Paris.

"Trap Syphonage." Report with illustration of experiments for National Board of Health. By Edw. S. Philbrick and E. W. Bowditch. Also by Col. Geo. E. Waring, Jr. Also in England by S. S. Hellyer, Esq. Interesting and valuable data.

"Coverings for Steam Pipes." Results of Some Experiments. By Mr. M. J. Bird.

"The Health of Boys' Boarding Schools." By D. F. Lincoln, M.D.

Weekly "Mortality Returns" of the leading cities in the United States, with "Notes and Abstracts" from reports of Health Officers and correspondents of the National Board of Health. There have been printed each week beginning with issue of Oct. 12.

"Tin in Canned Fruits." By Prof. Albert B. Prescott.

"Negro Mortality of Memphis." By Dr. G. B. Thornton.

"Pullman Sewerage." Abstract of paper describing it. By Benezette Williams, C.E., Engineer in charge.

"Letters to a Young Architect on Heating and Ventilation." By Dr. J. S. Billings, Surgeon, U.S A.

A model plan for an "Improved Tenement for Working Men in New York."

"Burning of Town Refuse at Leeds. A paper by Chas. Slagg, Assistant C.E.

"The Relative Uses of Gas and Electricity." By C. Wm. Siemens, F.R.S.

"Heat, House Plumbing and Mortality." By Lewis M. Leeds.

"The Management of Heating Apparatus." By Edw. S. Philbrick, C.E.

An extract from a paper by S. S. Hellyer on the "Unsealing of Traps by Momentum"—interesting in connection with experiments made by Messrs. Philbrick and Bowditch, and Col. Geo. E. Waring.

"Water Waste Prevention."

"Regulation of Exeter Water Works." A paper by Geo. I. Deacon, M. Inst. C.E., read before Society of Arts.

"Report of Boston Committee," and report of results in Cincinnati.

"The Massachusetts Law to Prevent the Adulteration of Food and Drugs."

"Notes on Prosecutions in Great Britain."

Practical articles on "Steam Fitting and Steam Heating," by "Thermus."

An illustrated article describing the "Accommodation for the Foreign Cattle Trade" at the port of Liverpool. By Francis Vacher, M.D.

Plan of "Flush Tank for Country Residences."

"Text of the Illuminating Oils Bill for New York State."

"The Effect of Water Level on Disease." By Baldwin Latham, M.Inst., C.E.

"A Form of Specification for Steam Fitting of an Eight Story Apartment House."

"Report on Oil Testers."

An article on the "Sewerage of Brighton, England." With reports by Sir Joseph Bazalgette and J. Bailey Denton.

A series of papers on "Water Analysis," from the *Analyst.*

"Lead Poisoning." By Dr. Edw. S. Wood, Harvard Medical College.

In addition to the foregoing, there are answers to a great variety of questions on the various topics treated by THE SANITARY ENGINEER, the usual record of patents granted and the weekly reviews of questions of current interest to sanitarians, and of the condition of the Gas and Electric Light Industries. This latter feature makes the paper of real value to inventors, since the aim is to state the facts without bias for either interest. Price, bound in cloth, $3. Postage 40 cents. P. O. Box 3037. THE SANITARY ENGINEER. No. 140 William St., New York.

Book Department.

The Business Manager of THE SANITARY ENGINEER begs to announce that he has established a Book Department for the sale of Books treating on subjects in which the readers of that journal have a special interest. Orders for Books are therefore solicited. Arrangements are being perfected to supply foreign scientific books promptly.

A line of Books on the following subjects kept in stock: Sanitary Engineering, Architecture, Construction, Engineering, Gas Manufacture, Electric Lighting, Sewage Disposal, Drainage, Plumbing, Food Adulteration and Hygiene. Lists sent on application.

BALDWIN, WM. J., STEAM HEATING FOR BUILDINGS. Or, Hints to Steam Fitters. Being a description of Steam Heating Apparatus for Warming and Ventilating Private Houses and Large Buildings, with Remarks on Steam, Water and Air in Relations to their Heating. To which are added useful miscellaneous tables. Third edition. With many illustrative plates. 12mo, cloth, $2 50

DREDGE, JAS. ELECTRIC ILLUMINATION. General Principles, Current, Generators, Conductors, Carbons, and Lamps. By Conrad W. Cooke, M. F. O'Reilly, James Dredge, S. P. Thompson and H. Vivarez. Chiefly compiled from Engineering, edited by Jas. Dredge; with abstracts of the specifications deposited at the Patent Office between 1837 and 1872 having reference to Electric Lighting, prepared by Mr. W. Lloyd Wise. About 600 pages text, nearly 800 illustrations...4to, cloth, $7 50

LOCK, WIGNER & HARLAND. SUGAR GROWING AND REFINING. A Comprehensive Treatise on the Culture of Sugar-Yielding Plants, and the Manufacture, Refining, and Analysis of Cane, Beet, Maple, Melon, Milk, Palm, Sorghum, and Starch Sugars; with copious Statistics of their Production and Commerce and a chapter on the Distillation of Rum. By Charles G. Warnford Lock, F.L.S., Editor of Spons' Encyclopædia of Manufacturers and Raw Commercial Products, and G. W. Wigner & R. H. Harland, FF.C.S., FF.I.C., Public Analysts, etc. Illustrated by 10 plates and 205 Engravings.....Demy 8vo, cloth, $12 00

BENJAMIN, PARK. WRINKLES AND RECIPES. Compiled from the *Scientific American*. A collection of practical suggestions, processes and directions, for the Mechanic, Engineer, Farmer and Housekeeper. With a Color Tempering Scale, and numerous wood engravings. Revised by Prof. Thurston and Vander Weyde, and Engineers Buel and Rose. 12mo, cloth, $2 00

DU BOIS, A. J. THEORY OF STEAM ENGINE. Translated from the fourth edition of Weisbach's Mechanics, containing notes giving practical examples of Stationary, Marine, and Locomotive Engines, showing American practice. By R. H. Buel. Numerous illustrations..... 8vo, cloth, $5 00

DU BOIS, A. J. THERMO-DYNAMICS, THE PRINCIPLES OF. With Special Applications to Hot-Air Gas and Steam Engines. By Robert Röntgen; with additions from Profs. Verdet, Zeuner, and Pernolet. Translated, revised, and enlarged by Prof. A. Jay Du Bois, of Sheffield Scientific School. 670 pages, 8vo, cloth, $5 00

HATFIELD, R. G. THE AMERICAN HOUSE CARPENTER. A Treatise on the Art of Building, comprising Styles of Architecture, Strength of Materials, and the Theory and Practice of the Construction of Floors, Framed Girders, Roof Trusses, Rolled Iron Beams, Tubular Iron Girders, Cast Iron Girders, Stairs, Doors, Windows, Mouldings, and Cornices, together with a Compend of Mathematics. A Manual for the Practical use of Architects, Carpenters, and Stair Builders. Re-written and enlarged. Numerous fine wood engravings. (1882)..... .....8vo, cloth, $5 00

HATFIELD, R. G. THE THEORY OF TRANSVERSE STRAINS, and its Application to the Construction of Buildings, including a full discussion of the Theory and Construction of Floor Beams, Girders, Headers, Carriage Beams, Bridging, Rolled Iron Beams, Tubular Iron Girders, Cast Iron Girders, Framed Girders and Roof Trusses, with Tables calculated expressly for the work, etc., etc. By R. G. Hatfield Architect. Fully illustrated. Second edition with additions. (1880) 8vo, cloth, $5 00

"COFFEE."

FROM PLANTATION TO CUP.

A BRIEF HISTORY OF

COFFEE PRODUCTION AND CONSUMPTION.

With an Appendix containing letters written during a trip to the coffee plantations of the East, and through the coffee consuming countries of Europe.

By FRANCIS B. THURBER.

Price, $3.00.

CONTENTS.—Introductory; The Plant and its Culture; Preparation of Coffee for Market; The Selection of the Bean; Roasting the Bean; Grinding, Blending and Mixing Coffee; Making the Coffee; Early History of Coffee; The Mocha Berry; The Java Berry; Sumatra, and other Java Sorts; Cultivation in Ceylon; Cultivation in India; Liberian and other African Growths of Coffee; Empire of Brazil; The Brazilian Product; Coffee Culture in the West Indies; Maricaibo and Laguayra Coffee; Coffee Product of Central America; The Coffee Industry in Mexico and other Countries; Adulteration of Coffee; Chemical Analysis of Coffee—its Medicinal and other Properties; The Coffee Trade; Coffee Consumption of the World; The King of the Coffee Trade; The Tropics' Best Gift.

Sent, postage paid, on receipt of price.

The following back numbers of THE SANITARY ENGINEER are worth preserving, and will be sold at prices quoted until further notice:

February, 1878..... 50 cents.

Contains an article on "Plumbers' Profits." Useful when a plumber's bill is disputed, as showing what percentage of profit is necessary and legitimate.

April, May, June, July..... } for the set $1.00
and October, 1878..... } or 20 cents each.

These issues contain articles from E. S. Philbrick, C.E., on "The Ventilation of the Public Sewers;" Robert Briggs, C.E., on "Heating and Ventilation," and Col. Geo. E. Waring, Jr., on the "Sanitary Aspects of Plumbing."

December, 1878, and January, 1879.....each 30 cents.

Article on the Electric Light, by Prof. Henry Morton, President of Stevens' Institute of Technology, "Terms of the Competition for Improved Tenement Houses." Articles on the "Water Supply of Small Towns," by E. S. Philbrick, C.E., "Ventilation of the Capital at Washington," by Robt. Briggs, C.E. "Sanitary Condition of Tenement Houses," and Irvington Sanitary Survey," by Col. G. E. Waring, Jr.

March, 1879..... ....$1.00

Contains "Prize Plans in Tenement House Competition," with report of Committee of Award; a history of the movement which led to the passage of the Tenement House Act in New York.

March, April, May, June 1 and 15, and July 1, 1879, only a few left.....for the set $4.00

This series contains the ten selected plans on the "Model Tenement House Competition."

May, 1879.... .....50 cents

Has article on the "Holly System of Steam Heating," by Robt. Briggs, C.E. Article on the "Water Supply of Small Towns," by E. S. Philbrick, C.E., and seventh and eighth "Prize Plan in Tenement House Competition."

August 1, 1879 ....30 cents

"Plan and Description of a Model Paris Apartment House," by Lewis W. Leeds. Article No. 3 on "Domestic Sanitation," by E. S. Philbrick, C.E.

September 1 and 15, October 15, November 1 and 15, 1879..... .....each 30 cents

In this series is an illustrated description of the "Heating and Ventilation of the Utica Insane Asylum;" article on "Food Adulteration Abroad," by Prof. Henry Morton; "Domestic Sanitation," by E. S. Philbrick, C.E. Articles on "Water Gas—Its History and Manufacture," by Prof. Henry Morton, Ph.D. "Sanitary School Construction," by Dr. D. F. Lincoln; an opinion on the "Validity of the McCloskey Patent," by J. N. McIntire, Patent expert.

March 1 and 15, April 15, 1880.....each 50 cents

Valuable, as they contain results of "Model School House Competition," with report of the Committee of Award, and eight of the Prize Plans.

May 1 and 15, 1880 ....each 50 cents

Very valuable for reference, as they contain full report (illustrated) of Dr. Carmichael, of Glasgow, on his experiments to test the liability of sewer gas and disease germs to pass through a water seal trap. Often referred to.

October 15 and November 1, 1880... .....each 50 cents

An account of the "Heating and Ventilating Arrangements of the Madison Square Theatre;" "How to Utilize Exhaust Steam to Heat a Factory" (Illustrated). "English Adulteration Acts," by G. W. Wigner, F.C.S. An illustrated description of the Sewerage of Memphis.

December 1, 1880.....50 cents

Contains report of the Committee of Award in the "Food Adulteration Competition;" an article on "Recent History of Electric Lighting," by Prof. Henry Morton. A review of schemes for the sewerage of Newport, R. I, "Arsenical Wall Paper," by Dr. E. S. Wood, of Harvard Medical College.

May 15, 1881..... .....50 cents

A Review of Prof. Pumpelly's report on the filtering capacity of soil; an article on the "Safety of Theatres," by Jas. Harrison, Superintendent of the Board of Fire Underwriters, N. Y. A plan for removing ground water from a city house to the sewer (illustrated). A sectional plan of fitting up a Double Hot Water Boiler, as done in New York.

August 1 and 15, and September 1, 1881.....each 25 cents

Contains letters and articles giving full account of the system of Disposing of Refuse and Sewage at Birmingham, England.

October 1 and 15, and November 1 and 15, 1881....., ...each 25 cents

Review of Col. Waring's article in *Scribner's* on the "Drainage of New York." Article No. 1 on the system of "Water Waste-Prevention in Liverpool." Plan and description of a Sewer Weir and Geometrical Stair Case, designed by Sir Jos. Bazalgette, London; the Municipal Chemical Laboratory of Paris, by Dr. De Pietra Santa.

Address, BOOK DEPARTMENT, THE SANITARY ENGINEER,

P. O. Box 3037, 140 William Street, New York.

To Prevent Malaria.

Use PIETSCH'S STENCH TRAP, tried and found satisfactory by the United States Health Department apparatus.

Cannot siphon out.

Water seal always perfect.

Made of Brass, Porcelain or glass. When of Glass, the workings and benefits of the invention are plainly seen. Send for illustrated Circular. Address,

HERMAN PIETSCH, Manufacturer,

Manufactory, FLATBUSH, L. I.

WE invite the attention of Architects, Engineers, Builders and those interested in House Construction to the following important features of the

DURIIAM SYSTEM

OF

HOUSE DRAINAGE.

For drains underground we use heavy cast-iron gas pipe, 12 feet long, of *uniform* thickness and *tested* at the works *by hydraulic pressure* (300 lbs). Pipes and fittings are thoroughly protected against rust by Dr. Angus Smith's process. Our joints in cast-iron pipes are the same as gas companies lead joints. Bells of gas pipe are sufficiently thick to permit a thorough caulking in order to obtain a perfectly gas-tight joint. *Our drains are consequently free from leakage of foul water or foul air.*

For soil and waste pipes we use standard, wrought iron, lap welded steam pipe, tested at the works by 500 lbs. pressure, coated with asphalt. This pipe is made in lengths of from 17 to 20 feet, consequently we are enabled to *run from floor to floor without a joint.* Our joints are screw joints made by first-class steam fitters.

Our fittings are of original design, made especially for us, and effectually protected against rust by a coating of asphalt. We decline to sell fittings to be used independently of our knowledge or control. Our Company not only manufactures the materials it uses (except pipes), but it *constructs the drainage system complete, with its own workmen and under supervision of its own engineers.*

For further details call and see full size models at the Office of the Company,

187 BROADWAY NEW YORK.

JENKINS' PATENT

(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

INSIDE VIEW OF GATE VALVE.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

NEARLY three years ago the undersigned introduced to the trade in this country THE ROYAL PORCELAIN BATH.

Prior to that period it was little known, except to those Americans who may have seen them when traveling in Great Britain; while it is true that they had been used there for 25 years, and were universally conceded to be the finest thing in the way of a Bath Tub known, yet, like all things supposed to be new and of high cost, they required extensive advertising to secure their acceptance and use to any considerable extent in the United States.

The effect of numerous expressions of opinion, made without either knowledge or experience to justify them as to their durability and utility, had to be counteracted, yet, as a result, we have succeeded in having them selected for some of the most elegant residences that have been erected within the past ten years. They have also been used in several hospitals, for which places we make a special, less elaborate, and cheaper class of fittings.

A personal inspection will convince any one of their superiority. Their increased cost over that of an ordinary copper-lined bath tub should not be a consideration to those who can afford to live in a house worth over $15,000, and would not be if their cleanliness, inviting appearance and durability was appreciated.

MEYER, SNIFFEN & CO.

46 & 48 Cliff Street,
New York.

N. B.—We have imported a line of sinks, which are made of the same non-absorbent material as the ROYAL PORCELAIN BATH TUBS. They are admirable for Hospitals. They have been used in some of our elegant New York residences, where their expense was no objection. They are one and one-half inches thick, and are less likely to be broken than cast iron. We have a size in stock that would make an admirable "Foot Bath."

"THE DU BOIS" TRAPS.

These Celebrated Traps are made in the same way as lead pipe—Sound and Smooth, Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

The "National" Patent Side Outlet Closet and Trap.

WITH IMPROVED FLUSH. (Registered).

Made either complete in one piece of Earthenware, or in two pieces with Basin and Trap separate

An important alteration has been made in the *flushing* arrangement of this closet. The *supply* is now placed *opposite* the *outlet*, and a *new registered fan* attached which makes the closet more effective, and with less than two gallons of water it is guaranteed to perfectly flush out the soil and thoroughly wash the inside of basin.

The Most Cleanly, Durable, Effective and Cheapest Closet and Trap ever used, requires no fittings nor Machinery of any kind, and cannot get out of order.

For the perfect working of this closet a supply pipe not less than 1¼ inch must be used.

MANUFACTURED BY THOS. TWYFORD, HANLEY, STAFFORDSHIRE, ENG.

Sole Agent for the Manufacturer, E. ASPINALL, 206 Pearl Street, New York.

PLUMBERS' AND SANITARY EARTHENWARE OF ALL DESCRIPTIONS.

Illustrated Catalogue and Prices Furnished the Trade on Application.

SECTIONAL VIEW OF VALVE.

BENNOR

Syphon Trap

Will recommend itself to

Architects, Plumbers and Sanitary Engineers.

Because; First—It is a perfect seal under all circumstances, with or without water.

Second—By the peculiar construction of the valve in connection with its syphoning force, the trap and adjoining pipes are kept clean and free of coating

Third—It cannot become clogged.

Fourth—It is simple, durable, cheap and easily adjusted.

BENNOR SYPHON TRAP CO., LIMITED.

17 North 9th St., Philadelphia, Pa.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

MEYER, SNIFFIN & CO.'S

No. 1

WATER-CLOSET APPARATUS

CONSISTS OF A

HELLYER WATER-CLOSET,

With the Cistern from which it is supplied, a pair of Brackets, the Floor Lever Chain and necessary fittings, except the lead pipe and trap.

The names of some of the parties using them and those having them for sale with full descriptive circulars, will be mailed on application to us.

MEYER, SNIFFIN & CO.'S No. 3 A

WATER-CLOSET APPARATUS

CONSISTS OF A

HELLYER'S *ARTISAN HOPPER,*

WITH IMPROVED FLUSHING RIM.

FLUSHED FROM OUR

No. 2 A Preliminary Flush Cistern.

PATENTED.

Complete with seat, and all attachments ready for putting up, except lead pipe.

This is an admirable arrangement for Stores, Tenement Houses, Servants' Use, or any public place, where people neglect to lift the handle or properly flush an ordinary Water Closet.

This Hopper is of Earthenware, of novel shape, and with improved flushing rim, when supplied and fitted up as shown herein, always clean. When seat is depressed, a valve is raised, and Service Box filled with water, to extent of two and a half gallons. When seat is relieved of weight, the valve before referred to is closed, another one opened, when the contents are suddenly delivered through an 1¼ pipe to the Hopper, carrying all solid matter through the trap.

By a valuable improvement in the construction of our No. 2 Cistern—which is patented—a preliminary flush of half a gallon is secured, which thoroughly wets the entire inner surface of the hopper. The trickle is dispensed with, thus economizing the use of water, and very much better results are secured.

In ordering, describe as "*Meyer, Sniffin & Co.'s No. 3 A Water Closet Apparatus.*"

These Hellyer Hoppers are sold with various flushing apparatus, their efficiency largely depending on the selection. It is for this reason that we never sell the Hoppers unless we are satisfied that the flushing arrangements are suited for the particular duty required.

"IMPERIAL"
PORCELAIN BATHS,

PARIS, 1878.

Manufactured in England exclusively for, and Imported only by

THE J. L. MOTT IRON WORKS,

88 and 90 BEEKMAN STREET, NEW YORK.

"IMPERIAL" PORCELAIN BATHS.

For Private use (two sizes). No. A, 5 feet 6 inches long, No. B, 5 feet long

"IMPERIAL" PORCELAIN BATHS.

For Hospital and Asylum use (two sizes). No. A, 5 feet 6 inches long, No. B, 5 feet long.

The "IMPERIAL" Porcelain Bath, moulded and glazed in one piece, is without doubt *the finest piece of ware that has yet been produced of the size*, perfectly modelled, delicate and uniform in color, with a glaze which is simply wonderful on so large on article as a Bath Tub. From both a sanitary and economical point of view these Porcelain Baths recommend themselves; they are non-absorbent, will never wear out and entail no labor scouring or burnishing, requiring only to be wiped out with a sponge to be made perfectly clean. As regards the fixtures we have only to say, they are manufactured by ourselves in the very best manner, being made entirely of Brass, with nothing to break or get out of order. An important feature in the Fixtures is the McFarland Waste, which, for simplicity, durability and cleanliness is unexcelled. It will also be noticed that the fittings are complete in themselves, requiring no extra overflow pipe or other pieces.

The Baths for Asylums are fitted so that the supply and waste handles can be enclosed and only accessible to the janitor or party in charge. The value of these baths for hospital use cannot be over-estimated, forming as they do a most important adjunct in the treatment of skin and other diseases.

*NOTE.—*Occasionally we have on hand a few Tubs with slight defects, which for use in hospitals or asylums are absolutely as good as the perfect Tubs, and which we will sell at a reduced price.*

COMPLETE ILLUSTRATED CIRCULARS WITH PRICES ON APPLICATION.

All our Sanitary Specialties are fitted up with water attached and may be seen at our Warerooms, 88 and 90 Beekman St.

Send for Illustrations.
AMERICAN TOOL & MACHINE CO.
84 Kingston Street, Boston, Mass.

THE RUSSELL VALVE *has stood the test for nine years. It has a composition movable disk that usually will last about two years, and can any time be readily replaced.*
MANUFACTURED ONLY BY
T. R. McMANN & BRO.,
Manufacturers and Dealers in
WROUGHT IRON PIPE AND BRASS AND IRON FITTINGS FOR WATER AND STEAM.
56 and 58 Gold Street, New York.
Send for Descriptive Catalogues, with names of prominent buildings where used.

Peck Brothers & Co.,
Manufacturers of
BRASS COCKS,
FOR WATER, GAS AND STEAM.
No. 73 Beekman Street, N. Y.
(Works, New Haven, Conn.)

NEW DESIGNS IN GAS FIXTURES, CLOCKS, Bronzes, Lamps and Ornamental Metal Work.
Artistic in style, and of the best material and workmanship, are offered by
MITCHELL, VANCE & CO.,
836 and 838 BROADWAY, NEW YORK.

LINCRUSTA-WALTON.
THE NEW AND PERMANENT
WALL DECORATION.
Now being used extensively by the first architects and decorators in Europe.
41 Union Sq. (cor. Broadway and 17th St.,) N. Y.

MINTON'S TILES, *Glazed and Unglazed.*
For VESTIBULES, HALLS, HEARTHS, etc., and for Exterior Decoration. Also, Plain White, and Tinted Tiles, for KITCHENS, BATH ROOMS, WATER CLOSETS, etc.
Also, PLUMBERS' MATERIALS of all kinds
MILLER & COATES,
279 PEARL STREET, near Fulton St., NEW YORK.

Otis Brothers & Co.
Standard Hydraulic Passenger and Freight Elevators, as used in the largest buildings and adopted by the United States Government, can be seen at United Bank Building, Liverpool & London & Globe Insurance Co. Building, Boreel Building, Post Building, in Hanover Street, etc.
Safety Steam Elevators for all purposes, such as Factories, Warehouses, Stores, Mills, Mines, Blast Furnaces, etc., etc.
☞ *Circulars sent on application.*
WORKS AT YONKERS, N. Y.
OFFICE AT 348 BROADWAY, NEW YORK.

HEAT SAVING and VENTILATING
GRATE,
EDWIN A. JACKSON & BRO.,
77 Beekman Street, New York.
THE CHEERFUL, COMFORTABLE FIRE OF THE OPEN GRATE. THE HEATING POWER OF THREE ORDINARY GRATES. CAN BE ARRANGED TO HEAT ROOMS ON TWO FLOORS. AN UNLIMITED SUPPLY OF PURE WARMED AIR. MADE OF THE FINEST FINISH IN NICKEL, BRONZE OR BRASS.
☞ Send for descriptive circulars and designs.

STEINWAY & SONS'
Pianofortes,
Steinway Hall, 109-111 East 14th Street, *New York.*

MR. C. N. DOUGLASS'
SCHOOL FOR BOYS.
Thorough preparation for the best Colleges and Scientific Schools and for business. Pupils received at any time. The classes are small, and much of the teaching individual. References furnished on application.
No. 1298 Broadway cor. Thirty-fourth St., N. Y.

SPECIALTIES AND GENERAL SANITARY EARTHENWARE.

ADVERTISEMENTS 351-360

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

British Subscribers who wish to receive this paper, without interruption should renew their subscriptions a month before expiration, with Messrs. E. & F. N. Spon, London, in order that they may be able to notify the Publisher, in New York, of the fact.

NOTICE.—Correspondents will prevent needless delays and annoyance if they will address all communications, except those of a strictly private nature, to THE SANITARY ENGINEER. Checks should also be drawn to the same order.

INTER-STATE RELATIONS OF WATER SUPPLY.

The Connecticut Legislature has before it a bill to create a joint commission selected from the State Board of Agriculture, the State Board of Health and the State Fish Commission to investigate the subject of the pollution of streams in the State, and to experiment upon the utilization for agricultural or other purposes of the excreta and refuse of manufacturing processes which at present are polluting the streams. The matter is one of great and increasing importance, and this city and State are deeply interested in whatever action may be taken with regard to it by the State of Connecticut; since the tributaries of the Croton lie in that State.

The general principles of the common law with regard to the pollution of streams, as laid down in various decisions of the courts, may be summed up as follows.

There is no special property in or ownership of *running* water. The owner of the soil over which it runs has certain rights with regard to the use of it, but these rights do not depend upon any ownership of the water itself. Every one has a right to have the air and water which comes over his land to come there with their natural purity and in their usual volume except in so far as these may be impaired by a reasonable use for the usual and ordinary purposes of life by those over whose premises this air and water have previously passed. On the other hand every one over whose land water flows has certain usufructuary interests in it, which interests pass with the soil, and to that extent may be considered as property which may be sold or leased.

"Thus one person may be the owner of the soil over which a stream flows and yet have no interest in the water which flows there; or he may have a partial interest therein according to the terms or conditions of the grant by which he holds the soil. It is not water itself which thus becomes the subject of bargain and sale, for no man owns that, and consequently no man can sell it, but it is the beneficial use to which it may be applied by the owner of the land while passing over the soil that becomes the subject of traffic."*

The owner of the bed of a stream is the one who owns the banks. If he owns but one bank he owns the bed of the stream to the centre, no matter whether this stream be wide or narrow. He has the right to use this water for the support of life in man or beast, which is called a *primary* right, and also to use it for manufacturing purposes, which is a secondary right, and if the stream only furnishes enough water for the *primary* rights of those upon its banks, no one has the right to use any of it for the *secondary* purposes. No one has the right to diminish the quantity of the water which will, according to the natural current, flow to a proprietor below, except for the primary purposes just referred to, nor can he throw the water back upon the proprietor above.

No one has a right to put into a stream anything which can work detriment to other persons residing on the stream or using the water. The questions to be determined in each case are, first, the fact of the pollution of a stream with matters which cause discomfort or danger to others having the right to use the water, and second, what constitutes a reasonable use.

In addition to the common law many States have statutes relating directly or indirectly to the pollution of running streams. For example, Connecticut forbids, under penalty of one hundred dollars for each offence, allowing any substance deleterious to fish to flow or drain into or be placed in any waters having fish therein. Such a statute cannot, of course, be literally enforced.

But when it comes to a question between the rights of citizens of the State of New York to have the water of the Croton and Byrum rivers delivered to them from the State of Connecticut pure and free from anything that can harm them, no statute law is applicable, and in case of infringement of these rights, it would only be possible to bring the complaint before the United States Courts under the provisions of the common law.

The investigations proposed by the commission above referred to will probably amount to very little—no doubt they can make a readable report condensed from the reports of the extensive investigations which have been made by the English government on this subject—but to make any real substantial addition to our knowledge on this subject will require the employment of skilled chemists, etc., who can give their entire time to the subject, and who will not begin to be useful in less than four or five years. It is a matter for the general government to undertake, and not for any single State, the principle being precisely the same as that which we have urged as applying to preparing standards for the adulteration of food, viz., when information is needed which is for the benefit of the whole country, it should be obtained under the direction and at the expense of the United States.

A TENANT'S RIGHTS.

A case has recently been decided in Chicago which is of interest from a sanitary point of view.

A tenant in an apartment house suffered from defective plumbing, leakages, and sewer gas, and notwithstanding his frequent requests that the proper and necessary repairs be made, the landlord neglected and refused to make them.

The tenant then, still remaining in possession, refused to pay his rent, whereupon the landlord brought suit.

In delivering its opinion the Court said it had not the slighest doubt that the building was wholly unfit for human beings to live in, and it was the necessary result of landlords desiring to build their houses in as cheap a manner as possible; yet, nevertheless, so long as the tenant remained in possession of the premises he must pay the rent, and if so disposed might sue the landlord for damages, or he could vacate the premises, surrender his lease and relieve himself from further liability for rent.

This decision does not conflict with the principle laid down by the Court of Appeals in this State in the case of Cesar *vs.* Karutz which we have already commented upon. In the latter case the defendant did not refuse to pay rent; but as suggested by the Chicago Court sued her landlord for damages on the grouud that he had knowingly rented her rooms in his house which were infected with small-pox, in consequence of which she was taken ill of the same disease. The jury under instructions rendered a verdict in her favor for $1,500 and the Court of Appeals sustained the verdict.

NEW YORK'S WATER SUPPLY.

No. VIII.

THE SUPPRESSION OF WASTE.

(Continued from page 314.)

Considerable pains are taken in the examination of water closet cisterns, and in this respect the standard required in Liverpool is higher than anywhere else we know of. A specification was prepared, giving the most minute details for the information of manufacturers, and this must be strictly conformed to, it being held, and very properly, too, that if not accurately made, these appliances are waste preventers in name only, and on this account we have taken the ground that unless the waste preventing cisterns contemplated to come within the minimum tax fixed by the Department of Public Works are carefully examined and tested, they will fail to secure the results aimed at; indeed, for that matter, without careful inspection and good management the whole movement, which is susceptible of doing a great good, will prove disappointing.

The various patent so-called waste-preventing valves are not allowed. Prior to 1873 single cisterns were used with one valve, and so arranged that the ball cock was held up when the valve was lifted. These were so poorly made that they proved unreliable, and they were first opposed because they were provided with a ground key ball cock, it not being considered practicable to adjust levers with a ball cock that came to a dead stop, and as the ground key ball cocks were constantly leaking, this fact influenced the prohibition of the single cistern.

In each waste preventing or double valve cistern, there must be $\frac{3}{16}$ of an inch play after the valve is closed before it can be approved, and this is carefully looked after by the testing officer. The rules prescribe that the measuring compartment shall hold two gallons, which is ample for the hopper forms of water closets, but where special kinds of water closets are used that need a little more, special tanks are sanctioned so long as they are so constructed that there is a limit to the amount that can be drawn at one lifting of the valve. The main point sought after is to prevent a constant running of the water should any one fasten the handle up, a practice often resorted to by persons who have defective plumbing, and imagine that a trickling of water will "keep down the sewer gas."

It should be remembered that in Liverpool, as elsewhere, much opposition at first prevailed, but the water committee, which had the respect and esteem of the community, loyally stood by their engineers and gave the support that a public official everywhere needs when required to enforce what are at the moment unpopular measures, and nowhere is that support more needed than in a city like New York.

It is but justice to state that much of the credit of the success achieved in Liverpool was due to a Mr. Wilson, since deceased, who was indefatigable in his efforts to facilitate the methods of inspection, and to secure the adoption of the details essential to the proper enforcement of the necessary measures.

As in the other cities we have described, no fittings, or class of fittings, are selected that any firm has a monopoly of making—though it often happens that patents are procured on some detail, it is never on any *essential feature required by the authorities*—consequently the widest latitude is given to the purchaser, he being simply required to use articles that are well made, water-tight and capable of fulfilling the requirements of such devices. Whenever, therefore, the authorities in this country attempt to prescribe the character of fittings, they will find the domain covered by no patents sufficiently wide to secure what the public need, and what any manufacturer can make if he chooses to, at least, so far as plumbing fittings are concerned.

In 1881 we learned from Mr. Parry, the engineer then in charge of the distribution of water, that 122,673 houses were supplied with water by the corporation; the population was 725,000, being an average of 5.91 persons to each house. The average rate of consumption for all purposes was 23 Imperial gallons per head daily, which included five gallons per head for trade purposes measured by meter, about three gallons for sanitary purposes and miscellaneous trade uses, charged for by assessment, leaving about fifteen gallons per head daily for domestic purposes, stores, hotels, public buildings and all waste. Water closets are general in Liverpool, and each one is required to be so fitted that it can be flushed with two gallons in a few seconds; private baths are common, and of late years it has been the practice to put them in all new houses renting for more than $90 per year. There is a considerable demand for shipping, and public fountains are numerous. In order to sum up the results secured by the adoption of efficient measures to restrict waste we cannot do better than quote from Mr. Thomas Hawksley's address as President of the National Association for the Promotion of Social Science, delivered at Liverpool in October, 1876:

"Under the able management of Mr. Deacon (Borough Engineer) the supply has been changed with great advantage from a restricted intermittent to an unrestricted constant system, and as a consequence of the admirable method he has devised and adopted for the discovery, suppression and prevention of waste, the municipality has emerged, as respects the quantity of water at its disposal, from a state of actual poverty—poverty in the midst of plenty—to a condition of redundant wealth. It has enough and to spare."

"To provide a town with water of a suitable quality is now a matter of great difficulty and much expense. Competent and available sources are becoming fewer and fewer, and must in general be sought at distances always becoming more remote. Moreover, the value of land, labor and materials, is almost day by day advancing, and so rapidly and steadily, that the present cost of a reservoir is, as I know by repeated experiences, double what it was less than thirty years ago."

In view of these facts so forcibly stated, is it not stupid to clamor that "water should be free as air," and should it not be considered a crime to waste and deprive others of what they are entitled to?

[TO BE CONTINUED.]

FIRE IN A FLAT.

A fire in the Cambridge, an apartment house in the upper part of this city, early last Wednesday morning, spread with such rapidity that two of the inmates were unable to escape and were suffocated while descending a stairway. These flats are so prominent a feature in the building of this city that this fire has caused great excitement, in which there is not much surprise, for the fate of the Cambridge is what might reasonably be expected of 95 per cent. of those erected in this city. The only difference hitherto has been that they have not caught fire. Nothing but stringent laws will make these edifices reasonably fire-proof. If the well-to-do become alarmed and refuse to occupy them, a limited number will be built fire-proof to get such tenants as will pay. The great mass of people, however, will take their chances and consider location, finish, style and low price as an off-set for safety.

BAD PLUMBING IN A PUBLIC BUILDING.

Our exchanges have lately reported several instances where the condition of court rooms has become so bad that the judges have taken summary action to remedy the nuisance. One of the most aggravated cases was that of the Columbus, O., Court House, where Judge Bingham, of the Court of Common Pleas, ordered a report by a committe on the subject. They concluded that its sanitary condition is so bad as to be incapable of improvement. From details given in the *Ohio State Journal*, it appears that the court room received the foul air from a cellar once used for a jail, but in which at present the disused cells serve for the dumping ground of offal from the insane patients confined in apartments in the cellar. This offal was allowed to accumulate in the cells, and in addition an untrapped sewer connection allowed free entrance of sewer air.

We have noticed of late, a great deal of interest in plumbing matters on the part of ladies. A few months ago an elderly lady, with a house in the country, pooh-poohed certain protests which were made about the possible pollution of the water supply, using the time-worn argument of the health of a past generation, in proof of the foolishness of health agitation in this. Now, however, her tone has changed. Neither city house nor country house was altogether right. Plumbing is looked on with much respect and great interest. One of the most sensible, of the many sensible things which Mrs. Isabella Beecher Hooker said last summer at the Greenwood Lake conference, was the advice she gave to women about understanding the plumbing of their houses. She described her own practice of going over a job with the plumber until she understood every point of it, and her advice to others was to follow her example.

It is with deep regret that we have to announce the death of a member of our staff, Miss Alice Bogert, daughter of the late Horatio Bogert, Esq., which occurred on Thursday of last week at her home in Hackensack, N. J.

Miss Bogert had been connected with this journal since October last as an assistant in the editorial work, and quickly won the esteem of all who were witnesses of her thorough, faithful work. Such was her earnestness in her duties in this office, that though weakened by a recent illness, she persisted in daily coming in from Hackensack, until a few weeks ago her strength failed, and she was obliged to desist. Her illness was not thought dangerous until pneumonia set in, and she rapidly sank, her death being very sudden.

Miss Bogert had been for some years a contributor to rural and New York journals. Her funeral at Christ Church, Hackensack, on Monday, was largely attended by friends of her family and herself from this city as well as from the neighborhood.

SOLDIER'S HOME HOSPITAL
WASHINGTON, D.C.
1873.

PLAN OF BASEMENT
WITH FRESH-AIR DUCTS AND HEATING APPARATUS

LETTERS TO A YOUNG ARCHITECT.

ON

VENTILATION AND HEATING.

BY JOHN S. BILLINGS, SURGEON, U. S. A.

No. XLIV.

Since the publication of my remarks upon Dr. Burdon Sanderson's plan for a small-pox hospital I have received a letter from E. A. Jackson, of New York, calling altention to the fact that if the air be introduced in the inner circle, as I suggested, the outer parts of the room would not be warmed. The objection as regards a hospital in this climate is well taken, for although I was careful not to say that all the fresh warm air should be thus introduced, but only the greater part of it, it is nevertheless true that my criticisms were based entirely on the supposition that the hospital would be located in London. Where, as in the greater part of this country, provision must be made for temperatures at least as low as zero F., it is always desirable on the score of economy as well as for satisfactory heating to arrange the flues so that the foul air shall be taken from points in or near the floor of the room.

Of all small hospitals in this country with which I am acquainted, the one in which the heating and ventilation has been most thoroughly proved to be satisfactory, is the Barnes Hospital at the Old Soldier's Home near Washington, the general arrangement of which is shown in the accompanying illustrations.

This hospital is built of brick, and consists of a central administration building measuring 52x55 feet, two pavilion wings each 64x29 feet, and two end towers each 24x46 feet. The central building has a basement, three stories and mansard roof, the rest of the structure two stories, with basement and mansard.

The total amount of cubic space to be heated is about 310,000 cubic feet. The basement is occupied by the heating apparatus, which is hot water, and consists of two tubular boilers, each nine feet long and 42 inches in diameter, with mains, pipes and coils. The heating coils are of cast iron pipe three inches in diameter and are placed in fresh air chambers in the basement as shown in the plan.

At the point of entrance of the supply pipe to each coil is a valve by which the flow of hot water may be diminished to any degree and the temperature of the coil regulated accordingly.

The fresh air flues are of terra cotta pipe built into the walls and opening into the space above the heating coils.

The apparatus has maintained an uniform temperature of about 70° F. in the coldest weather, and the temperature can be varied at the different registers to suit the feelings of patients near them.

From May to September the doors and windows are usually open and for the most part the natural ventilation thus secured is sufficient, but on some hot, close days and nights in this period, when there is no wind, it becomes desirable to use special means to secure ventilation, and this is done by either aspiration or the use of the fan, or by a combination of the two.

When the natural ventilation by open windows is insufficient or impracticable, fresh air is supplied by a shaft eight feet in diameter and 38 feet high, placed 74 feet west of the building. This shaft is connected with a brick air duct 286 feet long which passes beneath the basement through its entire length and gives off branches leading to the air chambers containing the heating coils.

At the point of junction of the vertical shaft with the fresh air duct is located the fan, which is eight feet in diameter and has 24 blades, each 12 inches wide.

The motive power for this fan is furnished by a six-horse power engine, and the amount of coal required to run it is about 140 pounds for 24 hours. The fan is usually run at 60 revolutions per minute, giving a velocity in the air duct of from four to six hundred feet per minute, the cross section of the duct at its throat being 40 feet square. The removal of foul air by aspiration is effected by two chimneys in the administration building. Each chimney measures four feet four inches by five feet eight inches, and is 96 feet high.

A boiler iron flue two feet in diameter is placed in the centre of each chimney, extending from the basement to a height of three feet above the chimney cap; into these flues pass all the products of combustion from the hot water and steam boiler furnaces, as well as those from the kitchen range. Each flue has a basket grate at

WASHINGTON.D.C.
1873

its base in which a fire can be built when the furnaces are not acting.

Into the chimney shafts outside these flues empty the foul air ducts from the wards. These ducts are three feet three inches wide, one foot deep and 50 feet long, and are placed above and below the centre of each ward with which they communicate by accurately closing registers placed in the centre of the floor and ceiling. These foul air boxes are lined with tin and are cleaned daily.

Each ward contains 12 beds, is 50x24x15 feet, and has five foul air registers along the centre line of the floor and five in the ceiling.

Each of the upper registers has a clear area of 1.33 square feet of opening, and each lower register 1.5 square feet of clear opening. Each lower ward has 16 fresh air inlets, eight being ten inches above the floor, and eight ten inches below the ceiling; in the upper wards the upper registers are omitted. Each fresh air register has a clear area of one square foot.

The double set of inlets in the lower wards was arranged for experimental purposes to test the value of General Morin's theory that the warm air should be introduced at the ceiling. It was found that when this was done there was a difference of 10° in temperature between the floor and the ceiling and that the patients complained of cold feet and discomfort. It is also evident that when the warm air is introduced near the ceiling it is impossible to vary the temperature at different beds, a thing which it is often desirable to accomplish in a hospital.

The mean velocity of the upward current of air in the aspirating chimneys is about 180 feet per minute. With good fires in the grates at the base of the flues the highest recorded velocity was 700 feet per minute.

Each chimney under ordinary circumstances removes from the two wards connected with it about 36 cubic feet of air per second, or one and a half cubic foot per second per man.

This supply can be at any time doubled by the use of the fan. When fires are used at the base of the chimneys to accelerate the aspiration the consumption of coal is about 30 pounds of anthracite per hour per grate.

In my next letter will be given the results of observations made on the ventilation of this hospital by Surgeon D. L. Huntington, U. S. Army, from whose paper on this subject, prepared at my request, the above description has been condensed, and to whom I am indebted for very careful and valuable observations on the working of the apparatus.

(TO BE CONTINUED.)

THE CARE OF FIXTURES.

Our readers have been frequently advised as to the proper care of plumbing fixtures. The following hints from the *American Engineer* are well stated and worth repeating:

The most troublesome of all is the ordinary house sink, into which the bulk of the greasy water from dish washing is emptied. Contained in the hot water, the grease is dumped into the sink and out at the drain. Being chilled, however, in its contact with the cold metal of the sink or drain, it is at once deposited about the strainer and proximate waste pipes, the greater portion being deposited on the inner surface of the traps, where it remains to decompose. Here something more than water is necessary, and when, as with the modern flat or tenement, the sink is made the receptacle of the suds on wash days, the drain is kept moderately and sometimes perfectly clean by reason of the various washing sodas now in use. Though the grease has been deposited by means of hot water, it is not safe to expect that hot water alone will remove it, since it was the chilling of the hot greasy water that first deposited the refuse grease. There are special fixtures for catching this greasy deposit at various points along the drain, but the better way is to eradicate the objectionable and carry it off altogether.

Where the sink is used for kitchen purposes alone, and there are no weekly flushings from the wash tub, it is necessary to take pains to remove the grease by special means, introducing into the dish water some one of the sodas or ammonia. The tubs, whether in the laundry or bath-room, require moderate, though timely attention. In the case of the laundry tubs, the deposit of soft mud, left from clothes washing, is partially deposited at the lowest portions of the tubs, or sticks to the corners or joints, and if, as is often the case with what are called stationary tubs, a quantity of water is left in and the lids shut down, decomposition soon sets in, and an odor far more offensive than the sewer gas is experienced on lifting the lid or stirring the water. The tubs have to be thoroughly washed and flushed before the odor is thoroughly removed.

The application of disinfectants is of no use, cleansing must be resorted to. So, too, with the bath tub, a similar deposit is left from the water either at the bottom of the tub or in the drain, or more especially in the trap.

All this trouble from the tubs can be prevented by proper care and cleanliness after use. They should be thoroughly washed and flushed after each service.

With urinals another special method of cleanliness is necessary, for while there are no greasy deposits, such as already described, there is, owing to the very rapid decomposition that sets in, a special demand for immediate flushing after use, or they will shortly become most offensive. Constructed of a proper non-absorbent, non-porous and non-corrosive material, a liberal flushing immediately after use will be sufficient, unless contained in a close and warm room. If the room is not properly ventilated, it is next to impossible, even with a most liberal flushing, to prevent an unpleasant as well as an unhealthy odor arising.

The more complicated utensil, and forsooth the most offensive one, if not kept clean, is the water closet. It is the one upon which an attempt at false economy must not be permitted. It is the one upon which the most thought and care must be exercised in its construction and location. It is the one whose parts, as at present constructed, are least attainable for cleaning purposes. In it the parts are mostly, of necessity, constructed so that they hinder a free and unimpeded discharge of the refuse matter. Hence the necessity that these parts should be flushed, and if possible, thoroughly washed at short intervals.

The "big brown bear" of the following must have thought himself a tenent of an upper flat in a New York apartment house. "A big brown bear at the Black Hills found and ate a bushel of salt with great gusto. An hour later he was seen at the bank of a creek, assiduously drinking, and occasionally raising his head to look up stream and see if the supply of water was likely to hold out."—*N. O. Picayune.*

GERMS AND EPIDEMICS.*

In these days of the diffusion of knowledge; which is sometimes spread not only wide but thin; everyone is more or less familiar with the phrases "disease germs," "the germs of small-pox," "the malarial germ," etc., although some who speak of these in quite a familiar and patronizing way might, perhaps, find it rather difficult to state clearly the conception which they have as to the nature of these so-called germs, or as to the manner in which they produce disease. Very possibly, indeed, some may be inclined to consider these germs as being rather imaginary entities than actually observed things, an ingenious hypothesis rather than a demonstrated fact. It is the object of this lecture to state what we really do know at the present time about this subject, and to indicate the bearings of this knowledge in relation to epidemics.

That certain prevalent diseases are due to the entrance of minute living organisms from the air or water into the lungs or stomach, whence they work their way into the blood, is a very old idea. For example, Terentius Varro, a Latin author of the first century before Christ, says in his work "De re rustica," that marshy places are to be avoided because in them there grow certain minute animals which cannot be perceived by the eye, and which being carried in the air enter the body through the mouth and nostrils and produce very serious diseases." Varro states this as if it were an old and familiar idea, and it is quoted approvingly by subsequent writers, but no attempt seems to have been made to give the theory with precision until after the introduction of the microscope and the publication of the discoveries of Leuwenhoek. You can, perhaps, imagine the astonishment and delight with which those who used the first microscopes peeped into the new and unexplored world which lay before them; and as what is seen through this instrument depends quite as much on the training of the eye at the upper end as on what is placed beneath it, it is not surprising that some remarkable discoveries were announced.

Father Athanasius Kircher, in his treatise on the Pest, published in 1659, says, that with his new "Smicroscope" could be seen the extremely minute worms which cause the pest, and the writers in the next century made some similar announcements, but the theory was not fully formulated until after the cholera epidemics of 1832 and 1848, when it was urged by Dr. Cowdell that this disease was due to a minute fungus which inhabits the rice plant in India. Dr. Mitchell, of Philadelphia, taught in 1844-46 that malarious and epidemic fevers were due to minute fungi, and his essay is even to-day highly suggestive and interesting. The demonstration by Pasteur that various forms of fermentation and putrefaction of organic matter are due to vegetable organisms first put the matter on a scientific basis, and within the last ten years the germ theory of disease has found many advocates.

To understand the present prevailing views it is necessary that we should know the meaning of certain terms much used in discussions on this subject, and often used in a very confused way, since the words bacteria, germs, microzymes, etc., are not only used by different authors, but by the same author at different times, in different senses. In the first place we want some word to designate the great variety of particles which we find throughout all air and water under ordinary circumstances, and which are almost invariably present in decomposing organic matter—minute bodies, most of which are perceptible only with the best microscopes, and which present the most characteristic phenomena of life. These we will call microdemes, or little living things, and under this term are included the microphytes, or little vegetable organisms, the microzoa or minute animals, the microzymes or little ferments, the microbes or microbia of Pasteur, meaning literally, little lives, the bacteria, etc. Mingled with these microdemes there are usually other minute particles which are not living, and which may be either organic or inorganic. It is often extremely difficult, and sometimes impossible, to distinguish these from the microdemes, but usually the latter may be known by the uniform size and minuteness of the granules, their independent motion, and by signs of growth and reproductive division as shown by their being found in pairs or chains. The minutest spherical forms of these microdemes are called micrococcus or little grains, and when these are joined to form a chain they are called streptococcus or arthroccus. The short cylinders or rods are called bacteria, a term which is often improperly used to include the whole class. The microphytes, properly so called, are classed between the algæ and the fungi forming what Professor De Bary calls the Schizomycetes and Naegeli the "Spaltpilze."

At present it is not believed that these microdemes are ever spontaneously generated, or arise from any source other than living organisms. There is no proof that the microphytes which cause the various forms of fermentation, or putrefaction, develop into the higher forms of fungi, such as the common moulds; but this is not yet a settled question, and some careful observers believe that at all events certain common moulds may act as ferments. Since decomposing organic matters vary greatly in composition, and give very different products, while the microdemes which they contain also vary slightly in size and mode of grouping, it is a question whether the different results depend on a difference in the microdemes or a difference in the matter on which they are nourished.

The prevailing opinion at present is that there are many kinds of microphytes, each having special powers, and that each can only propagate its own kind within a certain limited time. But it also seems possible, that by changing the food of these organisms, and varying the temperature, the process of evolution and natural selection to fit them to their new surroundings goes on very rapidly, and that the result is the production of what might be called new species having very different habits and powers. But we must remember that all microdemes are not minute fungi, nor are they all germs. Using the words germ and organism in the ordinary sense, the germ theory is that certain diseases are due to the presence, and propagation in the system, of minute organisms which have no part or share in its normal economy. The word germ, however, is applied not only to independent organisms which originate outside the body, but also to living particles of protoplasm or cells forming, or which have formed, a part of the body itself, which are not microphytes, and can hardly be called independant organisms.

Let us now briefly consider some of the diseases produced by organisms foreign to the normal or healthy body. When these organisms are comparatively large and well known, the diseases which they produce are called parasitic. Of those which are thus produced by fungi, the best known are certain skin diseases, such as some varieties of ring-worm and the so called liver spots. One peculiar variety grows in the ear, another is sometimes found in the windpipe and lungs. These diseases are called mycoses, and are for the most part confined to the skin and mucous membranes, being those surfaces of the body which are either exposed to, or in free communication with the air. In other words, they are superficial affections, and the fungi do not appear to enter the blood, or to be generally distributed throughout the body. Even in that curious disease called mycetoma, or the fungus foot of India, where the comparatively large threads of a fungus penetrate the foot and ramify throughout its tissues, finally destroying them even to the bones, the disease is entirely local, being confined to the affected foot; and it appears to be necessary that there should be some wound or injury of the skin to permit the parasite to gain an entrance into the interior.

One of the most important of the diseases due to fungi of the nature of the common mould, is one which has for some time been known in cattle but was first observed in man about four years ago, the so-called actinomycosis. It occurs locally in the form of a tumor near the lower jaw, and also in a general or internal form, in which last case it is always fatal. The fungus seems to gain admission to the tissues usually through carious teeth, and gives rise to tumors and abscesses containing small yellow bodies, which are bundles of the threads of the fungus. Let us contrast with this a disease due to the presence of minute vegetable organisms in the blood, such as splenic fever, in which the fact that these organisms were the cause of the disease was first clearly made out. Splenic fever, also known as anthrax, contagious carbuncle, the black quarter, the Siberian plague, and malignant pustule, affects sheep, cows, and horses, and also man. In the blood of animals suffering from this affection, there are found large numbers of short straight, motionless rods or bacteria, about as long as the diameter of a blood corpuscle. These were discovered over twenty years ago, and it was known that blood containing them transmitted the disease with great certainty, provided it was fresh These rods, however, did not explain many of the peculiarities of splenic fever, the cause of which sometimes seems to adhere very tenaciously to certain limited localities, as, for instance, to a stable, or to one small field, where it would reappear after intervals of several years. It was found that the rods rapidly lost their vitality, and that the contagious properties of the blood containing them soon disappeared; and from this it was evident that if the contagion or cause of the disease depended on the bacteria, these must exist in some other form which was more permanent. Time passed on, and a German botanist, Professor Cohn, discovered that many of the bacteria have a stage of development in which they extend into long, slender rods, or threads, which he called bacilli, and that at regular intervals in these threads there developed extremely minute, highly refractive, spherical bodies, which were finally set free by the dissolution of the threads, and to which he gave the name of spores. Upon these characters he defined a genus of plants, which he called *bacillus*, and in view of the shape of the little rods in splenic fever blood, he ventured to predict that these would be found, under some circumstances then unknown, to develop into bacilli and produce spores, which spores would prove to be far more permanent in their vital properties than the bacteria. This prediction was verified by a series of careful culture experiments carried out by Prof. Koch. It was found that the little rods, when placed in various animal fluids suited to give them nutriment, and kept at a temperature near that of the human body, began to lengthen in a few hours, and very soon grew into slender threads, which were from twenty to an hundred times the length of the original rods. In a few hours more, minute dots began to appear in these threads and went on to form spores, which being set free, sank to the bottom of the vessel. Now these spores are found to retain their life very persistantly in spite of all manner of ill-treatment. They may be wetted and dried, buried in earth for an indefinite period, but even after many years, when they are placed in contact with a proper nutritive fluid and at the right temperature, they will germinate and elongate into rods precisely like the originals from whence they sprung, and after repeated cultures in this way, the results will still produce splenic fever, when inoculated in animals, so long as and no longer than they will produce fresh rods and spores in culture fluids. Baron Seebach, of Saxony, had suffered great losses from the repeated occurrence of splenic fever on his estate, and finally began to suspect that the disease was propagated from the graves of dead animals. He observed one day that the clover was growing with great luxuriance over a place in the corner of his fields where a sheep dying of the disease had been buried two years before. A few days later he noticed that some one had stolen the clover which grew at that corner, and the next day a woman, one of his tenants, came to him with great lamentation to tell him that her goat had just died and her cow was very ill. It was found that both the animals were affected with splenic fever, and the woman confessed that they had been fed with the stolen clover. In 1865 Baron Seebach was minister to Paris, and he then drew up a memorandum giving his views, which memorandum was placed by the French minister of agriculture in the hands of M. Pasteur. He reported after investigation, that if the carcass of an animal dying of anthrax be allowed to decompose at once with free access of air and moisture, its virulence is soon destroyed. The ordinary bacteria of putrefaction take possession and do their work, which in this case is a highly beneficient one and gives us a hint of how one species of micro-organisms may be used to drive out, destroy, or counteract the effects of others.

But if the carcass be so buried that but a limited supply of air comes to it, as in damp clay soil, the *bacillus anthracis* goes on to form its spores, and there the locality becomes a dangerous one. These spores, buried for years, may be brought to the surface by earth worms, and thence find access through food or water to other animals.

Pasteur proved to the satisfaction of a commission appointed by the Academy of Medicine of Paris, that the germs of this bacillus were present in earth over the grave of an infected animal buried twelve years before, and also in the casts deposited by earth worms in similar localities. Closely analogous to anthrax is the disease of hogs, known as the hog plague, which is also due to a bacillus which can be cultivated outside the living animal. The *bacillus anthracis* is to all appearance identical with a very common *bacillus*, the *bacillus subtilis*, which is found in all infusions

* A Saturday afternoon lecture delivered at the National Museum, Washington, D. C., Feb. 17, 1883, by John S. Billings, Surgeon U. S. Army.

Digitized by Google

of dried grass or hay, the only apparent difference being that the bacteroid form of *bacillus anthracis* is motionless, while that of *bacillus subtilis* is very active. This *bacillus subtilis* is, so far as known, a perfectly harmless form, but a possible connection between the two forms was at once suspected, and after many experiments Dr. Buchner has announced that he can, by varying the methods of culture, transform the one into the other with great certainty. After carrying on the culture of the *bacillus anthracis* with free access of air for several hundred generations he found that it would no longer produce anthrax when inoculated, that it began to grow on the surface of the fluid, which is a characteristic of the hay bacillus, and finally that it would grow in an acid hay infusion which at the beginning of the cultures was fatal to it, in short, that it had become *bacillus subtilis*. The reverse process was more difficult; but by limiting the supply of air and gradually substituting animal for vegetable culture fluids he finally produced malignant anthrax germs from common sweet hay. His reported results are not yet accepted as conclusive however, and further and more careful experiments are needed to settle this question.

There occurs among fowls a disease which is commonly known as chicken cholera, not because its phenomena resemble those of cholera in man, but because it once prevailed in France at the same time as Asiatic cholera. The blood of fowls thus affected contains a microphyte which will grow and multiply in great abundance in chicken broth kept at a proper temperature. If a needle be dipped in broth containing this germ, and then dipped in other broth which has been sterilized by boiling, this last broth soon becomes turbid, and in a few days is swarming with the organisms. This process may be repeated a hundred times and a drop of the hundredth culture will produce the disease if inoculated as surely as would one from the first, nor will the disease thus produced be any the less virulent or fatal.

But if instead of making these successive inoculations while the fluids are still turbid, and the microphyte is flourishing, we wait from one to six months, the malignancy of the microphyte becomes greatly diminished, and when inoculated upon an animal it no longer produces fatal results and its effects seem at first to be confined to the production of some trifling local irritation. The virus has been, as Pasteur phrases it, attenuated. "The extraordinary and very important fact, if it is a fact, discovered by Pasteur, is that this tamed and attenuated microphyte does, nevertheless, produce a change in the whole system of the living animal, which is no longer susceptible to injection by subsequent exposure to the influence of the unattenuated germs." In other words, this attenuated virus acts as a sort of vaccine against the more malignant forms.

Having discovered this, Pasteur next tried to attenuate the virus of splenic fever in like manner but at first was not successful because the bacillus when cultivated would form spores, and the virulence of these spores did not diminish. At last he found that by keeping his culture broth at a comparatively high temperature, about 100° F. spores did not form, the attenuation could be obtained, and that this attenuated virus could be used as a vacine against splenic fever. This sort of vaccinnation is now undergoing a very extensive test in Europe—a large number of cattle in France, Germany and Hungary having been inoculated for this purpose.

What may be the real value of this protective inoculation is as yet uncertain; in part, because sufficient time has not yet elapsed to enable us to say whether the protection is permanent, in part, because this attenuated virus may reassume its virulent properties if cultivated in young pigs—and very possibly under other circumstances.

[TO BE CONTINUED.]

The Municipal Commission of Paris, appointed to study the question of improved dwellings for the working population, have held a meeting at which it was decided to find out and classify those unoccupied sites belonging to the Communes in the poorer quarters of the city, the most suited for the construction of cheap tenements; to establish the conditions, plans, etc., of the proposed buildings; and to arrange for the carrying out of the work.

New hotel regulations: Guests jumping from fifth-story windows will be charged extra. In the office of the hotel is a large fire-proof safe; the proprietor will not be liable for any guest who does not deposit himself in it for the night. Johnson fire pumps, served in the rooms, charged extra. Guests are requested to pay their bills before going to bed, as they may not have time while the fire is burning.—*Philadelphia Chronicle-Herald*

FRESH AIR INLET.

Col. Geo. E. Waring, Jr., has sent us the illustration of which the accompaning sketch is a reproduction. Though the interior arrangement is not in accordance with what we now consider the proper requirements, we reproduce it

because the fresh-air inlet is shown. The interesting point is that this was in a report on sewerage made in 1873 by Mr. David W. Cunningham to the City of Lowell.

EXPLOSION OF A STEAM TABLE.

LONDON, W., *Jan.* 31, 1883.

To the Editor of THE SANITARY ENGINEER:

I cannot quite endorse what you say as to the non-staying of steam pads such as used at the Lochiel Hotel (SANITARY ENGINEER, Vol. VII., p. 148).

I have for years constructed similar fittings, and in scarcely any case is it necessary to stay them, being one-half inch thick, and the steam admitted at three pounds at the greatest, and the condense full open three-quarter inches, little or no pressure is likely to be felt on the surfaces, as the steam being admitted at so low a pressure is condensed almost before it passes through the table. But on "no" account in these fittings should the stop valve be

placed in the condense pipe, as is, I am sorry to say, often done with the false notion that more heat is obtained. This, perhaps, was the cause of the explosion at the above hotel.

I see the steam was from the engine condense; now this is unfair to the engine, as it must tend to give a back pressure to the engine.

What I do if I get steam for cooking and serving purposes from the engine boiler, say at 40 to 45 pounds, is to fix a stop valve at *A*, with a gauge glass above it at *B*, and a safety valve at *C*.

It will be seen that by closing *A*, the steam can be regulated to any pressure on the glass *B*, say ten pounds, or what is required in the boiler room to give five in the kitchen department. If by any chance it gets over ten the safety valve relieves it, and so prevents accidents which would otherwise occur.

Reducing valves, however good, when once fixed are seldom or ever touched, whereas this small contrivance speaks for itself.

Trusting if this is not quite clear I may be asked for further explanation, I am yours very truly,

F. BOTTING.

[The arrangement described above will do, if one has a weak steam table which he will not abandon for a strong and properly stayed one, *provided there is no valve on the waste* or condensed water pipe. But it must also be attended with a comparatively great loss or waste of steam.

It all depends on the attention given to the valve *A*. If *A* is not opened sufficiently the cook soon knows it, because his table is not hot enough to suit him; but he cannot tell when he has the maximum heat (without wasting), the return being open.

The notion that heat is *obtained* by a valve in the waste pipe *is false*, but that heat can be *retained* by it *is correct*, and furthermore the temperatures can be increased by it (by increasing the pressure), which is often desirable.

But the real question is, Why construct any apparatus so frail (when it is possible to do otherwise) that special contrivance, liable to get out of order, have to be arranged to prevent its bursting?]

HYDRAULIC RAM.

CHARLESTON, WEST VA., *Feb.* 24, 1883.

To the Editor of THE SANITARY ENGINEER:

I have a few questions to ask you in regard to elevating water with a hydraulic ram. I want to furnish water to tank, as shown in plan on other side; you will please tell me how much water it will furnish in 24 hours, or will it work at all? Answer by mail or through your valuable paper, and oblige,

Yours respectfully, FRANK FERGUSON.

[If there is plenty of water to waste, a ram will work to advantage in the case described. It will require about 15 gallons of water to operate the ram for every gallon delivered into the tank.]

The Savannah, Ga., aldermen have passed an ordinance fixing the amount of the bond given by plumbers and gas-fitters for the capable execution of their work at $2,000. During the consideration of the ordinance, a petition from the plumbers of the city was read asking the adoption of a measure that would enable them to give bonds in a prescribed sum, and not become liable for indefinite damage as under the previous ordinance.

The *Sanitary News* reports a case where a gentleman desiring a comfortable home gave his architect most definite instructions, but soon found that hardly anything was being done as he had directed. Finally, he thought he saw something wrong in the laying of the main drain, and reported to the architect, who was to be held responsible for defects. The workmen insisted that everything had been done just exactly as it should have been. The drains were dug up, nevertheless, and it was found that no connection had been made with the street sewer at all. The last section of the pipe had been too short by several inches, and to the crafty drain layer, who was interested in saving time and material, it was not considered necessary to lengthen it. The fresh-air duct leading to the furnace had been ordered to be built of unusual capacity, for the reason that the owner wanted none of the common difficulty about getting sufficient air to ventilate as well as warm his house. He watched the work on this air-duct very closely, and was congratulating himself that it was well made, but at last discovered that the workman narrowed the inlet by drawing in each succeeding course of bricks as he neared the top. When remonstrated with he said he thought he was doing the proper thing, as the duct wouldn't let in so much cold air if smaller. So in everything done about the house; the workmen had no more conception of the purpose which a healthy, comfortable, and convenient house was to serve than the tools which they used.

The school building at Nos. 278 and 280 Second street, this city, has been ordered vacated and torn down, in consequence of a report by Examiner Reily that the whole building was ten inches out of plumb, the front badly bulged, the west wall settled and cracked, and the rear wall overhanging about eleven inches.

Pipes froze and burst in a commercial building in Chicago. The plumbers who made repairs left a faucet running into a wash basin on the third floor when they went away. The waste-pipe being choked up the water ran over the floors and poured down into the basement and damaged $7,500 worth of goods. The building has always been an unfortunate one for its tenants. It was put up as a cheap, catch-penny affair.

CONNECTING A SINGLE BOILER WITH TWO RANGES.

ST. PAUL, MIN., *Feb.* 23, 1883.

To the Editor of THE SANITARY ENGINEER:

Please give me through your valuable columns the information of which I am in very much need. I fitted up a house a year ago and connected the boiler and stoves as shown in sketch, but failed to get hot water at fixtures upstairs when using stove in basement alone. I have tried most every way, but without success. Is it possible to heat water hot in such a case without the use of two boilers, and if so, which is the proper way to connect two boilers and two stoves with the same pipes? The stoves are good size ordinary wood stoves. Yours respectfully,

J. J. H.

[We presume when you say, "you fail to get hot water at the fixtures when using only the stove in the basement," that you do not get the water sufficiently warm. When the lower stove only is in operation the circulation is divided part of it circulating into the boiler, and part of it going through the coil in the upper stove; the upper coil

and all the long pipes being cooling surfaces for the water within them, and radiating surfaces to the surrounding air and objects. The draught alone through the upper stove, when it is cold, being a large cooling factor, not considering the long pipes, but taken together, they *may* be nearly equal to the heating power of the lower coil.

To get the best result you should cover your pipes and have a separate set of connections put on the boiler; but at the least you should cover the pipes and have an extra side connection on the boiler, to which to attach the hot water pipe from the lower coil.]

PLUMBING IN CINCINNATI.

(From our Special Correspondent.)

CINCINNATI, *March* 8, 1883.

Plumbing in Cincinnati is without any regulation. The duties of the Sanitary Department under the law have been confined to declaring overflow vaults, stagnant ponds, etc., nuisances, and plumbing has been done without any inspection, and to suit the proprietor's idea of economy. There are, therefore, vast numbers of sewer connections without traps or ventilation, and in comparatively few cases are the latter carried above the eaves. At first—that is many years ago—the plumbing was done by plumbers exclusively, but many, without any practical acquaintance with the art, have gone into the business. Formerly skilled plumbers were employed and their bills for artistic work paid; but latterly it has been the custom to give out to the work the lowest bidder. This has doubtless proved cheaper to the builders of tenement houses who look rather to the income on the investment than to the health of their tenants; but it has thrown much of the plumbing work into the hands of incompetent men. How many lives have been sacrifices within the last ten years to this economic spirit will never be known. A short time ago one man lost three children, which he attributed to bad plumbing that had to be all done over again. Another detected, just after it had been completed, that his house had been converted into a death trap, and paid a responsible plumber as much as the original cost to take it out and replace it properly. The plumbers have made an effort to have plumbing regulated, and to that end had a bill introduced, similar to that of your State in its provisions. But our State Solons, on whose suggestion is not known, conceived that it was in the interest of a class of business, and not of the general public, and laid it on the table. If all the plumbing work in Cincinnati could be uncovered there would doubtless be a marvellous revelation of bad work.

The Master Plumbers' Association of Cincinnati, at their meeting March 6, elected Hugh McCollom, President; John McNiel and Jas. Attlesey, Vice-Presidents; Wm. Ricketts, Treasury, and James Allison, Secretary for the ensuing year.

Judge Tuley, of Chicago, describes the condition of the jail and criminal court building in that city to be as follows:

"It is improperly constructed and improperly conducted. I discovered that the air I was breathing in the court-room had to pass over all the catch-basins in the building. In the basement, where the boilers for steam-heating are situated, no pure air enters, as the windows are kept constantly closed. The air in the basement is all the air we get throughout the building, and originally impure, it gets denser and more nauseating as it ascends, passing through pipes and ventilators placed over the closets. While sitting on the bench over there I frequently became sick at the stomach, and on investigating the cause discovered that I was inhaling the odors from a catch-basin situated immediately beneath an air-hole near the bench. The jail building is in the same condition. All the air they get in the jail comes from the basement where the boilers are, passing through a tunnel where the steam-pipes are laid. There was formerly a conduit through which fresh air could enter, but this was cut through in order to run the sewers, and has not been used since 1877. A well-hole outside in the court, which the engineer says frequently becomes half filled with water, is also unused. The large fan with which the air is distributed throughout the building might be a good thing if it didn't distribute impure sir. It gathers the impurities from the well-hole, which is impregnated with the filth of the sewers, and it dispenses it to everyone who is either in the court building or the jail."

This is the building which was recently the subject of a severe report by the Grand Jury.

The *Builder* of Jan 27 contains an article on heating and lighting, in which it is affirmed that—

"In America, in Germany, in Austria, it is only the vulgar and the uncultured population, the careless and indifferent, who heat their houses and workshops uncomfortably or unhealthily,—and unfortunately, in all countries, the uncultured and the indifferent form a terribly large number of inhabitants; but in America, in Germany, and in Austria, whenever consideration is given to the subject, as it is given invariably in the houses of the tolerably well-to-do, the mode of heating is simply perfect, and in all cases at a cost infinitely less than in England, where, had people of limited means to warm the very large rooms that most families on the Continent habitually occupy, they would have very little left of their incomes to supply the other wants of existence. After all, the most perfect way of heating large apartments consists in two essential requirements; in the first place, well-planned, well-secured, double-windows, without which no means of heating whatever will be effective; and, in the next place, a well-made 'porcelain' stove in which hard coal can be easily burned, by which means a room 30 feet square, and proportionately high, may, in the coldest weather, be kept at a perfect temperature, or as high as individual taste may desire, at no very considerable cost. The simple expedient of the double window is enjoyed by the poorest throughout Germany and Austria, while the 'porcelain' stove is rapidly replacing the abominable and unhealthy iron stove of the past."

We wonder whether the writer of this article ever heard of ventilation. It will be news to most of us that our systems of heating are "simply perfect." However, we suppose from this phrase that the author is of the æsthetic school, and that the article is prepared with a view to "general gorgeousness" rather than with any idea of giving useful advice or information.

The eighteenth annual report of the trustees of the Peabody Donation Fund shows the total fund on the 31st of December last to have been about $4,000,000. Since the last report, the trustees have opened 28 blocks of buildings at Great Wild Street, containing 1,670 rooms. Thirty-three blocks are now in course of erection which will contain 1,885 rooms. Up to the end of the year, the trustees had provided for the artisan and laboring poor of London, 7,829 rooms, exclusive of bath rooms, laundries and wash-houses. These rooms comprise 3,533 separate dwellings, occupied by 14,604 persons. The average rent of each dwelling was about $1.10 per week, and of each room 50 cents. The rent in all cases includes the free use water, laundries, sculleries and bath-rooms. The birth-rate for the year in the buildings reached 45.04 per 1,000, which is 10.74 per 1,000 above that of all London for the same period. The death-rate was 18.42 per 1,000, which is 2.98 per 1,000 less than London. The infant mortality was 137.41 in each 1,000 birth, or 13.59 per 1,000 below that of London.

APPARATUS FOR DISINFECTION OF CLOTHES, ETC.—In several hospitals in Berlin, Stettin, and other parts of Germany, the disinfecting apparatus of Schimmel & Co., of Chemnitz, patented about a year ago, is now used. The agent is heat (both moist and dry). The general arrangement is as follows:— There is a large case with double walls of sheet metal and a bad heat conductor between. This communicates with a chimney at the top behind, and in front has two doors; the upper doorway admits a frame-bearing wagon on rails, and the lower another wagon, also on rails, with the heating system. The former wagon has a permeable bottom and cross bars in the frame, from which are hung in linen bags the clothes to be disinfected. The lower wagon carries a thick tube which returns (horizontally) on itself, and bears a series of projecting ribs. Above and parallel with it is another tube of copper, with numerous small holes to let steam out. When the laden clothes wagon has been pushed into the upper part and the door shut behind it the steam valve of the of the connection with the rib tube system is opened, as also an air valve below and the chimney valve, and the heating proceeds till a thermometer, readable outside, marks 110° C. Then the steam and chimney valves are two-thirds closed, and the other steam valve, that of the perforated tube, opened. The steam is thus allowed to act directly about 20 to 30 minutes. After this tube is closed further heating by the other system is continued about a quarter of an hour, the ventilating valves being fully open. The process of disinfection lasts 1¼ to 1½ hour. The upper wagon may then be taken out and laden afresh.—*London Times.*

The Austrian Government Sanitary Council has prepared a set of regulations for life-saving on railways, and a guide to first help to those injured by accidents until the arrival of a physician. These have been sent to the several railway companies for examination and suggestions. Every conductor is to be provided with a leather case of bandages; a litter to be placed at every station and halfway between such stations as are more than nine miles apart; at every station a small case of surgical instruments, of specified kinds, is to be kept; that a larger supply of instruments and bandages at stations fifty and sixty miles apart, where there are reserve locomotives, which locomotives are to pick up the cars and litters on the way to an accident. Still more complete provision is to be made at important stations where there are many servants. For every 250 or 300 miles of road, at an engine-house, there must be an hospital car, of a specified pattern, used for carrying sick and wounded in time of war. The guide to first aid to the injured prescribes how the servants or others shall carry the victims of accidents, how place them, treat their wounds, apply bandages, transport them in the cars, and what to do in case of sudden illness.

VILLAR RESERVOIR ON THE RIVER LOZOYA.*

BY EDWARD JOHN THEODORE MANBY, M. INST. C.E.

The Isabel II. Canal, which conveys to Madrid the waters of River Lozoya, began originally at a point called Ponton de Oliva, where the required level was established by a dam 92 feet high. A supplementary dam, 16 feet high, was subsequently built at Navarejos, about three miles further up the river, and the canal prolonged up to that point; but the combined capacities of these reservoirs proved insufficient to meet the growing requirements of the capital, and it was decided in 1869 to construct a large storage reservoir at Villar, about 14 miles above Navarejos, capable of holding 20 million cubic metres (4,400 million gallons).

The construction of this dam began in June, 1870, and ended in 1878. The dam is curved in plan to a radius of 440 feet, the convexity being of course on the upstream side. The total length of the dam at the top, measured along this curve, is 546 feet, out of which a length of 197 feet on the right bank is eight feet three inches lower than the remainder, thus providing an outlet for the overflow of the reservoir. The overflowing water is directed down the valley, and kept from falling on the foot of the dam by a guide-wall 60 feet long, running radially to the curve of the dam, from the inner end of the outlet. An iron bridge, consisting of twelve spans of 16 feet, runs across the outlet, carrying a roadway which continues along the

top of the higher portion of the dam. It was necessary to provide a crossing for horses and foot-passengers over the dam, to replace the Villar bridge drowned by the reservoir.

The maximum height of the dam in the centre of the valley, from the bed of the river to the highest level the water can attain, *i.e.* the level of the overflow, is 162 feet one inch. The higher portion of the dam rises to eight feet three inches above this level, and is provided with parapets.

The figure of the cross-section of the dam can be very approximately described as follows:—The inside or upstream face is vertical from the line of the highest water-level to a point 84 feet three inches below, whilst the outer or downstream face batters at an irregular rate down to the same level.

The thicknesses down to this level run as follows:—

	Feet.	*Inches.*
At and above overflow level	14	9
" 10 feet below overflow level	16	5
" 20 " " " "	19	4
" 30 " " " "	24	3
" 40 " " " "	30	2
" 50 " " " "	36	9
" 60 " " " "	44	8
" 70 " " " "	52	10
" 80 " " " "	61	4
" 84 " 3½ inches below overflow level	65	11

From 84 feet 3½ inches below overflow-level the inside face batters 1 in 3.57, and the outside face continues with a uniform batter of 1 in 1.163, till they respectively strike the rock in the bed of the river.

Two galleries run through the dam at a depth of 143 feet below overflow level. Each of these has a clear inlet area of 19 square feet divided into two compartments, closed by sluices governed from a central tower built on to the inner face up to the level of the roadway. These sluices are worked by hydraulic power derived from a spring found on one of the banks 2,000 feet distant from and about 200 feet higher than the dam. The strain on each sluice-rod with a full reservoir is 8½ tons.

*From Proceedings of the Institution of Civil Engineers.

Besides these two galleries, four tunnels have been driven through the rocky sides of the valley to provide an outlet for flood-waters, and avoid, if possible, the higher overflow coming into use. Two of these issue from the same level as the galleries, a third one from a point 50 feet higher, and a fourth from a point 77 feet higher.

The whole dam is built of hydraulic rubble masonry, except the lower part of the tower and the top course of the dam, which are of ashlar.

The total cost of the reservoir, including the bridge and the tunnels, was £80,556. The materials were supplied by contractors, and cost £42,000. The construction was executed by day labor, and cost £38,566.

The sectional area of the dam from overflow-level down to a horizontal line 162 feet 1 inch below is 1,275 square yards, and may be considered as a fairly light one. The Furens dam, which is of about the same height (164 feet), only measures about 1,200 square yards in area; but the Gileppe dam, if carried up to the height of 164 feet (which emergency was contemplated and provided for by its designers), would present an area of 2,130 square yards. The type calculated in Krantz's work for a height of 164 feet has about 1,330 square yards area.

The Villar dam is slightly narrower at the base than the Furens dam, and much narrower than the Gileppe dam, or Krantz's type. Its thickness at 162 feet below overflow is about 154 feet. The Furens dam measures 159 feet at the corresponding depth, according to the plate in Krantz's work, and the Gileppe 216 feet. The Krantz type, for a height of 164 feet, gives 185 feet as the proper thickness at base.

Fig. 1 represents the comparative outline of the sections of the Gileppe, Furens, and Villar dams. Krantz's type is figured in dotted lines. The outline of the Furens dam has been taken from Krantz's work. That of the Gileppe dam has been plotted from the dimensions given in a notice printed in these Minutes, vol. xlviii., p. 312. The Villar dam was designed and constructed by Mr. José Morer, Chief Engineer to the Spanish Government.

NOTES FROM CHICAGO.

(From our Special Correspondent.)

CHICAGO, *March* 1, 1883.

The floods along the Ohio River, besides arousing in this community thoughts of relief, have revived interest in a question of home protection. Six years ago an overflow of the Desplaines River, ten miles west of the city, caused $100,000 damages in the southwestern section of Chicago, and the conditions lately have threatened another destructive visit of the waters. Similar overflows have happened almost annually. The trouble—to put the case in a nutshell—has always arisen from the gorging of ice at a sharp turn (almost a right angle) in the river at Summit, ten miles to the southwest, and the flowing back of water (reversing the current) through the Ogden Ditch (built for drainage purposes) into the West Branch of the South Branch of Chicago River. At this sharp bend, high rocks rise on one bank, skirted by the Illinois and Michigan canal, and a marsh stretches away on the other. The proposed remedy of straightening the river is impracticable on account of the cost of cutting through the rock. A plan now favored by the Commissioner of Public Works is to cut through into the canal, and put in locks, thus affording an extra outlet when needed. Time and money from the treasury of Chicago will be required for this, and in the meantime, Commissioner Cregier advises that extra precautions be taken (by the imployment of a large force of men during the spring freshets) against an ice gorge. Chicago is needing not a few public works, and this, from a sanitary standpoint, is not one of the least.

Health Commissioner DeWolf returned Saturday from his official mission of inspecting morgues in other cities, and a decent and, indeed, a model institution of the kind in this city is likely to result. I chanced to run across the Doctor this morning and asked him about his travels. While not disposed to criticise he said that the Philadelphia morgue was the worst he ever saw; Boston's was the newest, and New York's, on the whole, the best. Cincinnati's—well, it hadn't any to speak of. Plans for the Chicago morgue are now being drawn by Architect Genüng, Chief Inspector of Buildings. It will likely cost $25,000.

To turn to a matter of more living interest, a city ordinance exists requiring that all wires for telegraph, telephone, etc., in Chicago shall be underground by May 1. Indeed the charter of the absorbed Mutual Union contained a provision that their wires should be buried by this present date. The Western Union, however, since the consolidation, have strung many wires on the old poles. The only move toward carrying out the ordinance has been made by the Chicago Sectional Electric Underground Company, which, since Monday last, has been employing one hundred men in completing a mile of conduit on Wentworth avenue from Thirty-ninth street north. The conduit is four inches square, with capacity for 1,000 wires and is buried at the average depth of two feet.

Experiments will be made in a few days, by city officials among others, and if expectations are realized, the heart of the city will be lighted by electricity via this conduit by April 1. If the ordinance should be enforced rigidly, as some aldermen want it to be, here is an underground sheath for the various wires.

All public school buildings are being visited in turn by the building inspectors, and the result is divers recommendations in the alleged direction of greater safety from fires.

A similar motive shows itself in the continued aldermanic opposition to buildings over six stories, say, in height A prohibitory ordinance is probable, except where the fire-proof character can be guaranteed.

Chicago plumbers—a subject not least if mentioned last—are priding themselves on the good words which THE SANITARY ENGINEER has editorially said of them, and on the inner consciousness that the encomiums were all deserved. The meetings of the craft this past season have been largely attended and a credit in every way to the fraternity, and it has simply been the proper thing for other cities, as they have done in several instances, to send in for suggestions and advice as to how they should best form like useful organizations for themselves.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

Mar. 9, 1883.

A regular meeting of the Society of Civil Engineers was held on the evening of March 7, 1883. Vice President Wm. H. Paine, in the chair, John Bogart, Secretary. Messrs. H. D. Gates, of San Francisco, Gustav Lehlbach, of Newark, N. J., were elected members, and Wm. J. Haskins, of New York, a junior member.

The ballots for the amendments to the Constitution were canvassed.

A paper by Hamilton Smith, Jr., M. Am. Soc. C. E., of San Francisco, on the Flow of Water in Pipes, was read, giving the results of many experiments upon the discharge of water through circular pipes, ranging from ½ an inch to 4 feet in diameter, and with velocities from one-sixth of one foot to 20 feet per second.

This paper was discussed by Messrs. T. C. Clarke, J. J. R. Croes, Cooper, J. P. Davis, Emery, North and Wm. H. Paine.

At a recent meeting of the council of the American Society of Mechanical Engineers, Professor F. R. Hutton, of Columbia College, School of Mines, was elected Secretary of the society. The society's new office is at 15 Courtland street, room 78, and is open from 10 A.M. to 5 P.M. The Secratary's hours there are from 2 to 5 P.M., and at his up-town office, 50th street and Fourth avenue, from 10 A.M. to 1 P.M.

At a recent meeting of the Port-Glasgow (Canada) Town Council, Mr. Smith, meter-taker of Glasgow, was, by the casting vote of the chairman, elected to the office of water inspector. There were 134 candidates for the position.

Dr. G. W. Benson has been nominated and confirmed as Health Commissioner of Baltimore. He was first appointed Health Commissioner in 1872 and served one year, was again appointed in 1882, and is now reappointed. Much opposition was made to his confirmation, and the vote stood 14 for and 13 against.

A case recently before the Supreme Court of Wisconsin brought out the necessity of preparing a contract for building. The builder upon demanding his money was confronted by the owner, who claimed that he had used rotten timber. The contract, however, had stipulated the fact that the decision of the architect as to the quality of the material should be final. The latter having approved the timber, the owner had to foot the bill.

Gas and Electricity.

Illuminating Power of Gas in New York City.

Week ending	New York Gas Light Company.	Manhattan Gas Light Company.	Metropolitan Gas Light Company.	Mutual Gas Light Company.	Municipal Gas Light Company.	Harlem Gas Light Company.
March 10....	25.54	18.86	21.76	27.93	29.82	18.99

E. G. LOVE, Ph.D., *Gas Examiner.*

ELECTRIC LIGHT NOTES.

Trials of incandescent lamps in the trains running between Brussels and Antwerp are reported not to have resulted successfully because of the irregularity in the source of current.

The Edison Electric Light Company are wiring the "Da kota" apartment house (at Fifth avenue and 72d street) for 5,000 sixteen-candle power lamps, and the new sugar refinery of Messrs. Havermeyer & Elder (Brooklyn) for 900 lamps.

The French Government has decided to supply several of their men-of-war with Gramme machines and electric lamps. Among vessels already fitted up with incandescent lamps is the Redoutable. The lamps are Swan, the current supplied by Gramme machines driven byBrotherwood engines.

Pall Mall Gazette says that two eminent electricians promise to produce in a few months a perfectly practical electric tricycle, capable of running fifteen or twenty miles without recharging the accumulators, and able to ascend all such hills as are now possible for the foot tricycle, and even steeper gradients if auxiliary foot gearing be used to help the electromotor when the incline is great. The weight of batteries will not exceed the weight of a second rider, and will run at the rate of seven miles an hour.

The ballet at the Princess' Theatre, Manchester, in which twenty-six ladies take part, has for the past month been danced nightly by the light of small Swan lamps placed in a flower on each lady's head. The current is supplied by a small battery, the weight of which is about 1½ lb., carried on the back of the dancer, as at the Savoy Theatre. None of the ladies are at all frightened; in fact, they like it so much that the principal dancer, Miss A. Holt, has arranged to have her dress covered with the lamps, which will be done ere this is in print. The arrangements have been carried out by Mr. H. Bury, of 46 Market street, Manchester.—*Electrician.*

The Bulletin of the Edison Electric Light Company gives the following particulars about the installation in the Berlin Academy of Fine Arts. It consists of two grand electroliers at the entrance on the street, each mounted with five 32 candle lamps; 50 B lamps in a gigantic model of the Crown Prince just inside the entrance; on the staircase and in the vestibule are four three-lamp brackets and a chandelier with 12 A lamps; in the first *salon* four "sunburners" each with 15 A lamps; in the second *salon* are four chandeliers, two of which are each mounted with 18 A lamps, and two with 36 B lamps; a long gallery has five chandeliers, each with five A lamps; and a small *salon* has one chandelier with eight A lamps.

At a late meeting of the English Board of Trade the Secretary, Mr. Farrer, stated the conclusions which the Board had arrived at with reference to the electric lighting of the vestries. They wished the local authorities to act for themselves. If two companies applied for the same district the vestry must select the company. The Board would have no bogus companies. The area of supply chosen by the company must be restricted. The company and the vestry must agree on the area, and the Board would see that the company had enough means to work the area selected, and the money required must be set aside for that district. As regards the company's profits, and as to any portion of that profit going to the public, the Board would not listen to such a suggestion. The price must be regulated by competition with the gas company, and, if necessary, with other electric companies. Provision for safety against fire must be left to the public, the company and the fire insurance companies. No meter had yet been found to satisfy the Board; but when one was found it would be introduced.

Food and Drugs.

FOOD ADULTERATION IN CANADA.

Mr. E. Miall, Acting Commissioner of Inland Revenue, has made his report on Adulteration of Food in Canada for the year 1882. He gives the following table which shows the number of samples examined and the proportion adulterated:

Name of Samples.	Genuine	Adulterated.	Doubtful.	Total.
Baking Powder.....	17	..	..	17
Bread.....	81	1	1	83
Butter.....	141	48	8	197
Canned Fruit.....	24	2	..	26
Chocolate.....	54	..	..	54
Cocoa.....	43	10	..	53
Coffee.....	22	47	..	69
Flour.....	18	..	..	18
Ginger.....	7	16	..	23
Milk.....	130	59	13	202
Pepper.....	14	28	1	43
Potted Meats and Fish..	20	3	..	23
Spices.....	34	32	..	66
Sugar.....	65	..	..	65
Sweets.....	61	5	..	66
Tea.....	63	23	2	88
Water.....	15	14	..	29
Total.....	8[illegible]	283	25	1,122

The percentage of adulteration for 1882 was 25.66, as compared with 25.97 for 1891, There has been a decrease in this respect since 1876, when the percentage of adulteration was 51.66. For the past four years it has varied from 25.66 to 28.28; and from the figures given it is fair to infer that under present circumstances about one-fourth of the samples examined will be found to be adulterated. At present the Department merely publishes the results of the examinations, but were it to adopt a rigorous system of prosecutions, the number of adulterated samples would be considerably less. In speaking of canned fruits and meats, the Commissioner calls attention to the increased contamination of the contents of the cans with tin, etc. by age, and suggests that "manufacturers would consult best their own interests if they caused the packages to be stamped with the year when they were filled and sent out. Buyers could then purchase with some security, avoiding the risk of being taken in by goods packed for several years, and re-labelled in order to pass them off."

THE SALE OF SKIMMED MILK.

To the Editor of THE SANITARY ENGINEER:

I see by the daily papers that a bill has been introduced in the Assembly at Albany providing for the marking of milk cans in such a manner as to show the quality of the contents. Against such a bill I beg to enter my protest in the strongest terms. Instead of being a protection to consumers, it opens one great avenue for fraud by legalizing the sale of skimmed milk. The frightful mortality among children under five years of age in our city, shown by official records to be 45 per cent. of the total mortality, is known by all who have studied the subject to be caused by improper food, of which milk constitutes such a large part. The great objection to skimmed milk is that a large proportion of the fat globules, which make pure milk so nutritious, has been taken away. Feeding on this poor low-grade food creates a low vitality and predisposes the child to disorders that are so fatal during the summer months.

If this is the condition of things when the Board of Health employs inspectors to watch the milk coming into the city, and when there are laws providing for the punishment of those found selling unwholesome milk, what will be the mortality when the sale is legalized? Certainly not lower. Then, again, the low price at which it would be possible to sell skimmed milk, would induce multitudes of the poorer classes to buy it in preference to the pure and therefore more expensive article. Should the law permit the sale of an article in this city which is totally unfit for the purposes to which it is applied, and therefore dangerous?

It may be asserted that skimmed milk is a commercial article, and its sale cannot therefore be prohibited. Is not nitro glycerine a commercial article? and yet there are laws restricting its sale. Would it be safe to put it within the power of every boy to buy nitro glycerine? The public protects its members from dangers in one form; why should it seek to remove the safeguards against another? This bill is no new thing. It has been brought up year after year, and has either failed to pass the Legislature or has been vetoed by the Governor. Very much the same thing has been tried in other States, and it has been found that the law permitting the sale of skimmed milk from marked cans is a failure, and does not protect the public in any way, but on the other hand, the law offers a premium to the dealers in the fraudulent article. If this bill becomes a law, it will not only open the way for fraud, but, what is perhaps worse, take away all power of inspection vested in the Board of Health by the provisions of the Adulteration of Food Act, and the sanitary code. There are laws enough already to protect the community from the dangers of the indiscriminate use of skimmed milk. If the legislators are very anxious to do good let them provide for a yearly appropriation of money sufficient for the thorough inspection of the Board of Health under existing laws, of the half-million quarts of milk coming into this city daily. F. N. O.

[So far as we can learn the demand for this law does not come from milk consumers. We have, on previous occasions, expressed our views on the subject, and they have undergone no change. We trust the bill will not become a law. ED. SAN. ENG.]

EXAMINATION OF AMERICAN CHEESE.

Mr. A. B. Griffiths has recently communicated to the *Chemical News* the results of his analysis of four samples of American cheese purchased in London, The results are as follows:—

	No. 1	*No.* 2	*No.* 3	*No.* 4
Water.....	23.49	28.20	26.55	31.81
Caseine.....	36.21	37.01	35.58	36.10
Fat.....	34.92	30.18	33.85	28.68
Ash.....	5.24	4.51	3.90	3.40
	99.86	99.90	99,88	99.99

"The author also made a separate analysis of the rind in each case, and in samples Nos. 1 and 4 a small amount of arsenic was found. This was probably applied to the external surfaces of the cheeses to prevent the attacks of insects, etc., a practice which is dangerous to the consumer, and ought to be prohibited by law." The cheeses were also examined microscopically for vegetable fibers etc., and starch granules, but none were found.

The National Health Society of Great Britain have appointed a committee including Dr. Lauder Brunton, F.R.S., Dr. Farquharson, M.P., Dr. Cameron, M.P., Mr. Carr, and others, with the view of obtaining legislation to prevent indiscriminate use of arsenical and other injurious pigments in dress materials without mortification to the purchasers. Arrangements have been made for holding an exhibition of hygeinic dress, decoration, and domestic appliances on a large scale in London early in the coming season.

The Prince of Wales, President of the Society of Arts, writing to the late Sir Henry Cole, who had devised a scheme for organizing guilds of health in every parochial district in the United Kingdom, to supplement the local boards, say that "the labors of the Legislature to improve the broad conditions of health generally throughout the United Kingdom and the efforts of all local sanitary authorities, should be supplemented by the knowledge and exertions of every every individual. I conceive it to be most desirable that every one should make him or herself acquainted, not only with the elementary rules which science may give us, but also with the work of existing organizations for the preservation of good health, and I do not hesitate to express the opinion that it would be a most humane deed to set in motion measures by which everyone could be encouraged and assisted in obtaining practical information in connection with this subject."

CITY HEALTH DEPARTMENT NOTES.

No serious violations of the plumbing regulations were reported last week. Two trivial cases were reported by Inspector Eagleson. No violations of light and ventilation plans were reported. No cases were referred to the attorney.

During the month of February 6,458 persons were vaccinated by the Vaccinating Corps, of which almost all were in schools and public institutions.

An unusual quantity of "bob veal" is appearing in the markets. Over 4,000 pounds were siezed and condemned by the meat inspectors at the freight station of the Hudson River and Harlem railroads on Thursday of last week, and nearly as much a few nights before at the New Jersey ferries. Large quantities are also brought from Long Island. Some of the calves seized were said to be not over two days old.

Novelties.

Under this heading we propose to supplement our section on patents by descriptions and illustrations of new appliances put on the market. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and IT IS TO BE DISTINCTLY UNDERSTOOD THAT A NOTICE DOES NOT IMPLY APPROVAL. *No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.*

BOILER LUG.

This week's illustration represents a horizontal boiler *lug*, which is separable.

The shoe *a*, is riveted to the boiler shell before the tubes are put in, so as to admit of having the "point" or driven end of the rivet on the inside of the shell. The bracket *d* slips into the shoe forming the "*lug*."

We are informed that the driving of the rivets upon the inside insures tightness, as it admits of the wrought iron or steel of the boiler being drawn and hammered tightly against

the casting, whereas if the rivets were driven on the outside, no drawing could be done with the hammers, the shaping of the rivet only being all that is possible, which will generally leave a leakage past the head of the rivet and out between the metals.

The object of the arrangement is to admit of passing a boiler through a doorway through which it would not pass if the lugs were made in the ordinary way.

Baker, Smith & Co., we believe, are the first to use them, the boilers going into the building corner 28th street and 5th avenue being fitted with them; but Baldwin, in his work on steam heating, page 67, recommends them, and points out the objections to the old method.

Construction Notes.

BOSTON, MASS,—The Water Board will receive proposals until March 20, for cast iron water pipes for Cochituate Department; also for cast iron water pipes for extension of 48-inch mains. The estimate of quantities required is as follows:

First Contract—60 tons 10-inch pipe, Class A.; 600 tons 12-inch pipe, Class A.; 370 tons 8-inch pipe, Class B.; 300 tons 6-inch pipe, Class B.; 30 tons 4-inch pipe, Class B.; 80 tons special castings. Second Contract.—550 tons 48-inch pipe, Class A.; 90 tons 30-inch pipe, Class A.; 420 tons 24-inch pipe, Class A.; 150 tons special castings.

BROOKLYN.—The bill providing for the extension of Third avenue sewer, which has been signed by the Governor, is a work which is very much needed. The proposition it is to extend it from its present terminus at 28th to 43d street, down 43d to First avenue and thence to 49th street, where it will empty into the bay. The cost will be about $200,000 or $250,000, and will be paid by the city at large in the annual installments in the tax levy.—*Brooklyn Eagle, Mar.* 10.

KEENE, N. H.—The Springfield *Republican* says: "The sewerage question is likely to be a bone of contention in the new city government. A part of the members are opposed to the completion of the original plan, which they desire to give a trial, and then if found to be successful in the main street, through which it is now laid, to extend it to the smaller streets. Less than half the work laid out hy Col. Waring has been done. Other members of the council believe that the entire system should be completed, especially as the bonds have been issued and sold to pay for it, and as any attempt to reduce the amount of work would be resisted by the construction company, who have a contract for the entire system. The issue has not been squarely presented to the new city government and the result is doubtful.

LAFAYETTE, IND.—Proposals for low-pressure steam heating and ventilating apparatus including boilers, pumps, tanks, etc., for the new court house and for heating the jail will be received until April 18 at the auditor's office, of Tippecanoe County, in Lafayette, Thomas J. Barnes, auditor.

PORTSMOUTH, VA.—The contract for the water works, including buildings, pumps, conduit and distribution, has been given to John F. Ward, of Jersey City.

DURANGO, COL.—The Cincinnati and Newport Iron and Pipe Company, of Newport, Ky., have obtained the contract for furnishing cast-iron mains for the water works.

BUFFALO, N. Y.—Bids for furnishing the Water Department with cast iron pipe and special castings required for the year 1883, were opened March 3, as follows:

Lake Shore Foundry Co., Cleveland—	
Pipe per ton	$38.50
Special castings, per ton	70 00
Denin, Long & Co., Louisville, Ky.—	
Pipe, per ton, on cars	$36.75
Delivered on streets	1.04
Special castings, per ton	70.00
James Marsh & Co., Pittsburgh—

George B. Hayes was awarded the contract. About 18 miles of mains will be needed this season. A contract for valve boxes was given to Bingham & Morgan, at 2¾ cents per pound.

HYDE PARK, ILL.—The Board of Trustees have authorized the President to sign the contract with Rust & Cooledge for the construction of a bridge over the Calumet River, at $26,500.

PHILADELPHIA, PA.—The Park Committee have awarded a contract to Cornelius Kennedy for the construction of a sea wall for the east side of the River Schuylkill, opposite the Lincoln monument, for $21.90 per lineal foot.

Girard College uses a good deal of water, and has been paying the city of Philadelphia about $700 per year for the fluid supplied by the Water Department of the city. Looking upon this as extravagant, the college is now experimenting on artesian wells. A boring has been made about 500 feet, at a cost of some $8,000. The yield of the well at last accounts was *at the rate* of 100,000 gallons per day, but it is not stated how long the pumping was continued. The boring is continued in the hope of getting a larger yield. It will not take much more expenditure to make the annual charge for interest on cost of the well and the expense of pumping exceed the yearly rental paid the city for water.

NEW YORK IN 1940.

North of the embankment run the great boulevards known as Gould avenue, Field avenue, and Vanderbilt avenue. The latter is wholly occupied by the North American Home Company, whose magnificent apartment houses built on the new glass plan, as it is called, extend a mile and a half from the embankment. These homes are all roofed in by glass, which gives the street the appearance of an immense crystal palace. The chief advantage of the glass system is, that the whole area is kept at an equable summer temperature all through the year. No fires are needed in the houses. Tropical trees bloom at all times, and tropical birds make the air melodious with their songs. The street is an immense sanitarium, and has drawn residents from all parts of the country who are tired of struggling with the vicissitudes of the American climate.

The men who have built superb mansions about Mount Morris, in the heart of the city, have, as a rule, been engineers and presidents of corporations. I ought to have told you that the principal executive officer of the city is an engineer. He is sometimes spoken of as the Governor, but his proper title is Chief Engineer. The present executive rose from a poor boy to be very wealthy. He made his first great success in bringing Putnam county and Rockland county air to the city in pipes and furnishing it to every resident at so much per cubic foot. The guests at the hotels are now able to order their air at the office before retiring. Companies have since been formed to lay on mountain air and sea air.

At this point the reporter managed to obtain breath enough to ask: "But what do they want with air when they build their apartment houses fifteen stories high? I should think they would get all the fresh air they wanted."

"But you must understand," said the professor, "that now they are building the houses air-tight. Exposure to the vicissitudes of the climate is an exploded weakness. The houses are hermetic, and the air let in and graduated to suit the taste and constitution. No fires are needed."

"They don't cook. That's an annoyance that they do not have. Food is furnished in pipes. Every thoroughly equipped house has its milk furnished by the Orange County Company, whose mains run direct from their dairies and reservoir; and the Consolidated Bouillon Co. furnish every variety of liquid food. The advantages in cleanliness, convenience, economy and health are incalculable. Everything is laid on. The Concentrated Food Co. has its pneumatic tube in every house. A dinner for ten can be put in your——"

"But," said the reporter, "I should think it would make them nervous to sleep so high up in the air."

"But they don't sleep," replied the Professor. "Don't you understand that sleep is only necessary to repair the waste of tissue and recuperate the system that is broken down by exhaustion?

"The New Yorker doesn't exhaust himself now. His system has not got to eliminate vast quantities of chaff. He doesn't yet tired out, and doesn't need sleep. It is exposure to the atmosphere and innutritious food that wear people out."

"But the gas must vitiate the air in a tightly sealed house."

"Gas!" exclaimed the Professor. "Why, there hasn't been a foot of gas burned in New York in thirty years. What do they want with gas when the houses are roofed with the vitreous translucent patents, and the whole city is lit with a central electric sun on Mount Morris? When the people want extra light they use solar light."

"Oh, come now, Professor, solar light at night is too good!"

"Is it possible," replied the Professor, "that you do not know that solar light can be stored up like electricity, or any other form of energy? Every house is supplied with one of Edison's accumulators, which will store in ten hours light equivalent to fifty candles. I was just going to call you attention to the Aluminum Belt Tramway, which is to run from the Brooklyn precinct over the Grand Street Bridge to the embankment, entirely by solar energy. The health of the city has been very much improved by the pipe system.

"What is that?"

"Why, when it became apparent that everything was to be brought through pipes, a shrewd capitalist formed a company, worked the Chief Engineer and got a charter to take up the city, move the dirt out from under it, and lay

Digitized by Google

a solid foundation of iron pipes, that could be rented or let to the different corporations. Part of the city has been rebuilt in that way, and it has killed the miasm business. It is now proposed to roof in the whole of the Ninety-second precinct with glass.

"Would you like to know something about old New York?"

"No," said the reporter, "some other evening. What I have learned of the new will last me for a while."—*Morning Journal.*

At the meeting of the Engineers' Club of Philadelphia, the 3d inst.; Mr. W. S. Auchincloss described his latest forms of Averaging Machine, which is of interest to the engineering profession in its application to the location of engines, boilers and coal-bunkers in steamers, the determination of diameters of pulleys, speed of shafting and average haul of material.

Mr. J. J. de Kinder described the United States Metallic Packing for piston rods, valve stems, pump rods and throttles—exhibiting sections and model.

Col. William Ludlow has accepted the position of Chief Engineer of the Philadelphia Water Department, Congress having passed the bill granting him leave of absence for two years.

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

MISCELLANEOUS.

BOSTON, MASS.—A story is to be added to the United States Hotel at a cost of $100,000.

CHICAGO, ILL.—Architects Burling & Whitehouse have planned a $50,000 residence on Michigan avenue, for Mr. C. T. Yerkes. Messrs. Burling & Whitehouse are also the architects of three houses to be built this spring on La Salle avenue, near the corner of Oak street, for Mr. Kirkwood, the cost to be $30,000. The same gentlemen have planned a warehouse, 150 x 145 feet in dimensions, at Milwaukee avenue and Fulton street. The cost will be $55,000. They are also making plans for Mr. Swartz's new building on Madison street. Cost about $40,000. Architect George O. Garnsey has planned for Thomas Welsh a block of flats at the corner of Dearborn and Thirtieth streets, the material being brick and stone. Mr. Genung has drawn plans for the proposed morgue, to cost $12,000.

COLUMBUS, OHIO.—Among proposed new bulldings are the following: Allen C. Ady, two two-story brick dwellings, Warren street; cost $2,500 each....A Schwarz, three-story brick business block, West State street; cost $5,000.

INDIANAPOLIS, IND.—The council has determined to erect a city hall, to cost $150,000; architects, J. H. & A. H. Stern; dimensions 249 feet by 194 feet, two stories and basement.

MONTREAL, CANADA.—Two public baths to be erected are to be built from plans and specifications drawn by Mr. J. A. U. Baudry.

SAVANNAH, GA.—The contract for rebuilding the Butler Female College, recently burned, will be soon given out. The building is to be 60 x 70 feet and is to cost $70,000.

TROY, N. Y.—G. A. Stone will erect a brick dwelling on Second street; D. Little a brick flat on Congress street; cost $6,000.

THE NEW ORLEANS AUXILIARY SANITARY ASSOCIATION.

At the meeting of the New Orleans Auxiliary Sanitary Association held on Feb. 16, the President, Mr. Edward Fenner, delivered an able address reviewing the history and objects of the Association. This address is printed in full in the New Orleans *Times Democrat* of Feb. 19, and we select a few extracts. After an account of the organization of the Association at the termination of the epidemic of 1878, and of the Sanitary Council of the Mississippi Valley, he referred to the reports published by the Sanitary Commission which investigated the condition of New Orleans after the epidemic of 1853, saying:

"They are very voluminous. The researches were thorough—the conclusions arrived at in strict accordance with the added knowledge of sanitary and hygienic methods gained during the past quarter of a century. Nevertheless we do not believe that one citizen in a thousand has ever read these reports. They are out print, and this association is indebted to the editor of the German *Gazette* for the use of a copy.

"*We do know that their labor was all in vain.* Nearly thirty years were permitted to elapse before any adequate number of citizens volunteered to devote a portion of their time to the onerous but transcendent duty of making practical application of the invaluable sanitary suggestions of these commissions.

"No city can attain to the highest degree of prosperity in which there are not some wise and good men to teach, and other men to learn—nay more, what city can hope to prosper, in any degree, that is given over by its own citizens to those who make office-holding the profession of their lives? What avails an expressed devotion to State or city if we permit their affairs to be under the sole control and management of those who very frequently are least interested in their material prosperity?

"The experience of the past teaches us that other methods must be adopted than those we have supinely assented to, would we prevent any interruption to the good health and rapid recovery from the almost moribund condition of this city four years ago.

"What but the dread of yellow fever has prevented the more rapid growth of New Orleans? Who will gainsay the assertion that every epidemic retards our progress for years?

"In the past an immense territory was tributary to this city; events which we were unable to control, have worn new channels of trade. How to supplement this lost supremacy should now be our chief concern."

Extensive quotations are then given from the report of the Sanitary Commission published in 1854, much of which is applicable to-day, and the address closes by summarizing the improvements which have been effected in drainage, removal of garbage, flushing of gutters, etc., under the auspices of the Association. We are glad to learn that the address is to be printed in a cheap popular form and widely circulated.

Mr. Fenner and his associates are taking the right road to promote the commercial interests of New Orleans, and should be supported by her citizens in their work.

Patents.

[*It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, and Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.*]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

266,438. VENTILATING PIPE AND COWL. JOHN COOPER, Boston Mass. Filed Jan 3, 1882. (No model.) Issued October 24, 1882.

Claim.—A ventilating pipe, F, increasing in size toward the top, in combination with the cowl G, of greater diameter than the pipe F, and having the base plate *a* and the guard H, substantially as described.

266,434. SUPPLY TANK FOR WATER CLOSETS. JOHN COOPER, Boston, Mass. Filed Dec. 24, 1881. (No model.) Issued October 24, 1882.

Claim.—A double faced valve having two seats, one of the seats inverted and placed above the valve, in combination with a cylinder, plunger, check-screw, and air-port, substantially as and for the purposes set forth.

266,484. FAUCET. TOLBERT LANSTON, Washington, D. C. Filed June 2, 1882. (No model.) Issued Oct. 24, 1882.

Claim.—1. A faucet having, in connection with a water chamber a diaphragm therein and a check valve connected to said diaphragm an outlet passage leading from said chamber, and an inlet passage leading thereto from the seat of the turning or hand valve, substantially as specified.

2. A faucet having a main water passage or outlet and a secondary independent water passage, combined with the diaphragm chamber and the stop valve, the secondary water passage connecting said diaphragm chamber with the main water way beyond the seat of the stop valve, substantially as set forth.

3. In a faucet, the combination, with the chamber B, diaphragm H, and reciprocating stop valve E, of the hand valve F, valve chamber C, water passages, and the slide check R, substantially as specified.

4. A faucet having independent of the main water way a secondary water way through a diaphragm chamber, and an accelerating drip check rod in the outlet from said chamber, connected to the stem of a stop valve which is attached to the diaphragm in said diaphragm chamber, substantially as specified.

5. A faucet having a positive automatic cut-off or stop for the flow arranged in the main water way, and inclosed so as to be beyond the control of the operator, substantially as specified.

266,485. WASTE OR SEWER TRAP. COLIN LIGHTBODY, Brooklyn, N. Y. Filed Feb. 25, 1882. (No model.) Issued Oct. 24, 1882.

Claim.—1. The combination, with the trap, of an inclosed tank inclosing a float valve, and placed on a level with the sealing bend of the trap, or nearly so, having the base of its water chamber communicating with the sealing bend of the trap, its float valve connected with the water supply, and a suitable air vent opening from the top or air chamber of the tank, substantially as and for the purpose set forth.

2. A new article of plumbers' ware adapted for ready connection to traps, consisting of a detached and inclosed tank inclosing a float valve, with the neck of the valve opening or projecting from the exterior of the tank, and with an aperture or nipple opening from the base or water chamber of the tank, and a vent aperture or air vent nipple opening from the top of the tank, and the whole adapted to be connected with the plumbing of a house, substantially as and for the purpose herein set forth.

3 The combination, with a trap, of an inclosed tank, A, arranged on a level therewith and inclosing a float valve, with a communicating pipe, *h*, extending from the base of the tank to the base of the trap, a water supply pipe, *k*, connected with the float valve, and an air vent pipe, *i*, extending from the top of the tank to the top of the trap or its equivalent, substantially as and for the purpose set forth.

4. An inclosed tank formed in a recumbent L shape and inclosing a float valve, with external connections adapted to connect with a trap, substantially as herein shown and described.

266,531. BATH TUB. WILLIAM W. ROSENFIELD, New York, N. Y., assignor to the Portable Hygienic Vapor and Disinfector Company, same place. Filed July 26, 1882. (No model.) Issued Oct. 24, 1882.

Claim.—1. The combination, with an ordinary bath tub, of a flexible cover, as 5, provided with an opening, as 6, a perforated pipe, as 2, and means for connecting the same with the hot water cock, substantially as described.

2. The combination, with an ordinary bath tub, of the longitudinal perforated pipe, as 2, provided with a cock, as 9, for shutting the water off from a part of its length, substantially as described.

3. The combination, with an ordinary bath tub, of the flexible cover, as 5, provided with the opening, as 6, the perforated pipe, as 2, and means for detachably connecting the same to the hot water cock, substantially as described.

4. The combination, with an ordinary bath tub, of a flexible cover, as 5, provided with an opening, as 6, a perforated pipe, as 2, and a removable seat and foot rest, as 7 8, substantially as described

5. The combination, with an ordinary bath tub and its hot water cock, of the perforated pipe, as 2, flexible connecting pipe, as 3, nipple, as 11, plain annulus, as 13, and annulus, as 16, substantially as described.

6. The combination, with an ordinary bath tub and its hot water cock, of the perforated pipe, as 2, flexible connecting pipe, as 3, and means whereby the flexible pipe is coupled directly to the cock, substantially as described.

266,664. STOP-VALVE FOR WATER AND GAS. FREDERICK C. VINEY, Philadelphia, Pa. Filed Jan. 16, 1882. (No model.) Issued Oct. 31, 1882.

Claim.—1. A tapering valve-plug having several sides, and the vertically-movable valve-stem fitted to the head of said valve-plug, in combination with valve-seats N, formed of circular cavities filled with soft metal to correspond with the tapered sides of said plug, and outlets or passages covered by said valve-plug and corresponding in number and location with the sides thereof, substantially as set forth.

2. A vertically-movable valve-stem and the tapering valve-plug having several sides, each side covering a separate passage or outlet, in combination with removable hard-metal plates fitted to said sides, and valve-seats N, constructed to fit the tapering shape of the sides of said valve-plug, substantially set forth.

266,670. WATER-CLOSET VALVE. EMIL MOELLMANN, Cincinnati, Ohio, assignor of one-half to John G. Murdock, same place. Filed Sept. 4, 1882. (No model.) Issued Oct. 31, 1882.

Claim.—1. The chamber O, having an outlet, T, and an inlet, P, which latter is opened and closed by an automatic valve, as R S, said chamber and inlet communicating respectively by the pipes N and U V with the vessel G, whose wasteway *j* is opened by some of the operating appliances of the water-closet, substantially as herein described, and for the purpose set forth.

2. In combination with the vessel G, communicating by pipes N U V with the cylinder O P T, traversed by the automatically-acting valve R *r* S, in the manner described, the wasteway *j*, closed with the plug L, which latter is operated by the discharge-valve E of the closet, as herein described.

3. The vessel G, communicating with the valve-chamber O in the manner described, said vessel being screwed into the thimble H, with which latter is engaged the perforated guide-tube Jj^1, provided with the wasteway *j*, for the purpose described.

266,809. DRAIN AND SEWER. HENRY R. GREENLEAF, Boston, Mass. Filed May 26, 1882. (No model.) Issued Oct. 31, 1882.

Brief.—A section of the pipe is made gradually enlarged up to the covered aperture to facilitate cleansing.

Claim.—The section of drain or sewer pipe P, having the upward inclines *a a*, the aperture a^1, and the flanged seat a^2, as shown, combined with the cover *b* and securing means, and the whole adapted to serve as and for the purposes set forth.

266,408. FLOOD-GATE. HENRICH VOELMI, New York, N. Y. Filed Apr, 24, 1882. (No model.) Issued Oct. 24, 1882.

266,430. FLOOD FENCE AND GATE. JOSIE A. CLARK, Locust Grove, Ohio. Filed May 25, 1881. Renewed July 22, 1882. (Model.) Issued October 24, 1882.

266,446. ADJUSTABLE BRACKET FOR HEATING PURPOSES. JOHN H. EAGER, New Orleans, La. Filed July 19, 1882. (Model.) Issued October 24, 1882.

266,457. ARGAND LAMP. JOSEPH FUNCK, Tompkinsville, N. Y. Filed Sept. 6, 1882. (No model.) Issued October 24, 1882.

266,462. VENT-VALVE. EDWARD F. GORDON and Horatio Hobbs, Concord, N. H. Filed May 26, 1882. (No model.) Issued October 24, 1882.

266,478. DEVICE FOR BURNING CRUDE OIL IN STOVES AND FURNACES. JOSEPH F. IRONS, Bradford, Pa. Filed July 3, 1882. (No model.) Issued October 24, 1882.

266,506. STEAM HEATING APPARATUS. EUGENE F. OSBORNE, St. Paul, Minn. Filed Oct. 31. 1881. Renewed Sept. 14, 1882. (No model.) Patented in France Jan. 4, 1881, No. 140,479; in Germany Jan. 4, 1881, No. 15,588; in Belgium Jan. 5, 1881, No. 53,407, and in England Oct. 17, 1882. Issued Oct. 24, 1882.

266,510. LAMP. HENRY PEIGNIET, Paris, France. Filed Aug. 14, 1882. (No model.) Patented in France Oct. 11, 1881, No. 145,260; in England Feb. 9, 1882, No. 630, and in Belgium May 19, 1882, No. 57,962. Issued Oct. 24, 1882.

266,538. FORCE PUMP. GEORGE W. SIMONS and ROBERT H. GEBOTT, St. Catharines, Ontario, Canada; said Simons assignor to said Gebott. Filed April 18, 1881. (Model.) Patented in Canada Nov. 27, 1880, No. 12,031. Issued Oct. 24, 1882.

266,541. GAS BURNER GAGE. DEXTER M. SMALL, Providence, R. I. Filed July 9, 1881. (No model.) Issued Oct. 24, 1882.

266,542. GAS BURNER GAGE. DEXTER M. SMALL, Providence, R. I. Filed Oct. 29, 1880. (Model.) Issued Oct. 24, 1882.

266,543. GAS TEST AND PRESSURE GAGE. DEXTER M. SMALL, Providence, R. I. Filed Mar. 13, 1882. (No model.) Issued Oct. 24, 1882.

266,546. CAR VENTILATION. MARSHALL B. STAFFORD, New York, N. Y. Filed July 1, 1882. (No model.) Issued Oct. 24, 1882.

266,549. ELECTRICAL FIXTURE. LUTHER STIERINGER, New York, N. Y. Filed June 14, 1882. (No model.) Issued Oct. 24, 1882.

266,550. ELECTRIC LIGHT CHANDELIER. LUTHER STIERINGER, New York, N. Y., assignor, by direct and mesne assignments, to himself and Charles F. Harrington, same place, and Richard N. Dyer, Menlo Park, N. J. Filed Dec. 27, 1881. (No model.) Issued Oct. 24, 1882.

266,559. PERCOLATOR FOR ROSIN. CHARLES C. TYLER, New York, N. Y. Filed Sept. 27, 1882. (No model.) Issued Oct. 24, 1882.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

For the week ending March 3d of an urban population of 6,842,192 there died 3,038, which is equivalent to an annual death rate of 22.9 per 1,000, an increase over the preceding week for which it was 21.3; 14.1 per cent. of the total mortality was due to consumption, 11.3 per cent. to pneumonia and 3.3 per cent. to diphtheria.

For the North Atlantic cities the death rate was 19.7; for the Eastern cities 25.0; for the lake cities 18.7; for the river cities 21.8; and in the Southern cities, for whites 17.1, and for colored 40.6 per 1,000.

For the five weeks ending March 3d the mortality rate for an average urban population of 6,918,722 was 21.7, that for the preceding four weeks having been 21.8.

During this period of five weeks ending March 3d the average death rate in the North Atlantic cities was 20.8; in the Eastern cities 23.4; in the lake cities 18.2; in the river cities 20.3; in San Francisco 18.7; and in the Southern cities, white, 20.8; colored, 34.3 per 1,000. These figures may be compared with those for the month of January given in the notes on page 277 of THE SANITARY ENGINEER for February 22, 1883.

During these five weeks diphtheria caused 4.4 per cent. of all deaths in North Atlantic cities; 3.5 per cent. in Eastern cities; 5.7 per cent. in the lake cities; 3.6 per cent. in the river cities, and 2.1 per cent. among whites in Southern cities. Consumption caused 16.1 per cent. of all deaths in North Atlantic cities; 15.4 per cent. in the Eastern cities; 9.8 per cent. in the lake cities; 14.2 per cent. in the river cities; 9.8 per cent. in San Francisco; 15.2 per cent. among Southern whites, and 18.9 per cent. among the Southern colored urban population.

NEW YORK CITY LUNATIC ASYLUM.—Dr. T. M. Franklin, Medical Superintendent, reports for the week six admissions, six discharges, one death, and 1,332 insane patients remaining under treatment.

GREENPORT, SUFFOLK CO., N. Y.—Postmaster David Wiggins reports, under date March 5, six cases of scarlet fever in the village.

BOSTON, MASS.—C. E. Davis, Jr., reports 28 cases of diphtheria, 20 of scarlet fever, and five of typhoid fever.

CLEVELAND, OHIO.—Health Officer G. A. Ashman, reports that the city census, taken February of this year, returns a population of 194,000.

MILWAUKIE, WIS.—Dr. E. W. Diercks reports 12 new cases of diphtheria and 18 of scarlet fever.

DETROIT, MICH.—Dr. O. W. Wight reports 17 new cases of diphtheria and 19 of scarlet fever.

ROCK ISLAND, ILL.—Dr. G. G. Craig reports three deaths; under five years one; pneumonia caused one death and puerperal fever one.

PATERSON, N. J.—Dr. Wm. K. Newton states that during February there were reported to the city authorities four cases of diphtheria and 13 of scarlet fever.

PITTSBURGH, PA.—Dr. Snively reports the occurrence of four cases of small-pox.

FORT WORTH, TEXAS.—Mrs. Belle M. Burchill, P. M., under date of Feb. 26, reports 14 cases of small-pox and eight deaths from this disease.

MICHIGAN.—During the week ending Feb. 24, the prevailing diseases were bronchitis, rheumatism, intermittent fever, neuralgia, pneumonia, influenza and tonsilitis.

CONNECTICUT.—In his report for the month of January, Dr. C. W. Chamberlain, Secretary of the State Board of Health, says:—

This has been an unfavorable month for all lung diseases. The mortality from consumption is also comparatively large.

Hartford reports a large number of deaths from railroad accidents, mostly employés. It seems as if some additional safeguards could be provided in case of brakemen; of course nothing can prevent carelessness and inattention, from which the larger part of railroad accidents occur, but there are very many of these deaths preventable and require only a little outlay to secure, compared with the value of the lives lost.

Scarlet fever has been prevalent quite extensively in Hartford, while it has decreased very decidedly during the month in New Britain and Meriden, also in Middletown. It has apparently just reached New Haven, which reports but four deaths, although there had been occasional cases form time to time. It has extended over considerable territory and the cases have been quite numerous. It is apparently advancing, as new territory is reported each month.

Measles have been unusually prevalent in Thomaston, where there has been a sweeping epidemic. Over fifty cases were reported in January. Bronchial complications were frequent. They have not been unusually fatal, but few deaths are reported anywhere. It has been prevalent in New Haven and Ansonia and many towns in the southwestern part of the State, often, as in New Haven and Ansonia, accompanied with whooping cough. Measles are also reported from South Manchester, Plainville and Plymouth.

Diphtheria is reported from several towns, but in none as epidemic or unusually frequent.

CALIFORNIA.—The Secretary of the State Board of Health, Dr. F. W. Hatch, reports that the deaths in January numbered 172 in eighteen cities and towns, aggregating a population of 135,885, the annual rate being 15.18. The report from San Francisco is not included. Typhiod and typho-malarial fevers, so prevalent in the valley cities for the past three months, appear to be rapidly disappearing from mortality tables. A decrease is noticed also in the mortality from acute diseases of the respiratory organs.

Of the 172 deaths, 27 were caused by consumption, 19 by pneumonia, two by bronchitis, five by diphtheria, two by croup, two by scarlet fever, two by measles, three by whooping cough, three by malarial fevers, and eight by typhoid fever. No death is reported as having been occasioned by small-pox.

ONTARIO, CANADA.—The *Provincial Bulletin* for the week ending Feb. 24 reports that among fevers, enteric and typho-malarial have almost disappeared, but intermittents have continued prominent in certain districts. Diphtheria, like pneumonia, has perceptibly fallen in degree of prevalence during the week, as have likewise measles, mumps, and scarlet fever. The decline in prevalence of all zymotic diseases is considered much too general to depend upon accident, and hence would appear to be partially, at least, accounted for by the different character of the weather of the week, it having been steady, moderate, and with much sunlight, while that of the previous week was changeable, humid and cloudy.

KINGSTON, JAMAICA.—The return for the month of January shows 118 deaths; males 64, females 54; under five years, 31; 65 years and over, 12. Annual rate 38.0.

HAVANA, CUBA.—Dr. D. M. Burgess reports that there were two deaths from yellow fever, five from typhoid fever, and one from small-pox in the city during the week ending Feb. 23.

A number of cases of diphtheria have occurred during the past month. Measles prevails epidemically in the suburban towns of the Cerro and Mariano.

AUX CAYES, HAITI.—Consular-Agent Dutton reports five deaths from small-pox during the two weeks ending Jan. 27. The disease is decreasing in prevalence.

CITY OF MEXICO, MEXICO.—During the week ending January 21, there were 206 deaths; under five years, 102; over 50 years, 43. No deaths occurred from small-pox, measles or scarlet fever. Croup caused one death, typhoid fever eight, malarial fevers five, whooping cough three, consumption seven, pulmonary congestion six, and pneumonia and bronchitis 54.

ENGLAND.—Consul-General Merritt transmits the return of the registrar-general for the week ending February 17 which shows an average annual rate of mortality in the 28 large towns equal to 21.9 per 1,000 of their aggregate population. Birkenhead gave the lowest rate, 15.3, and Hull the highest, 27.5. The death rate of Bradford was unduly raised to 24.5 by the registration of 30 deaths resulting from the fall of a factory chimney in December last.

London.—2,732 births and 1,525 deaths were registered. The births were 51 and the deaths so many as 422 below the average numbers in the corresponding weeks of the last ten years. Annual mortality rate 20.1. Small-pox caused three deaths, measles 20, scarlet fever 29, diphtheria 14, whooping cough 35, typhus two, typhoid fever 23 and diarrhœa and dysentery 15. The deaths, 401, referred to acute diseases of the respiratory organs are 185 below the corrected weekly average.

IRELAND.—Consul A. B. Wood, of Belfast, sends a copy of the Registrar's return for the week ending February 17, a summary of which is given in our table.

Dublin.—Deaths 260. Rate 38.7. No deaths were caused by small-pox, measles, scarlet fever or diphtheria. Typhus caused three deaths, whooping cough 17, typhoid fever, diarrhœa and violence three each, and consumption 23.

Belfast.—Deaths 107. Rate 34.0. No deaths were registered from small-pox, diphtheria, typhoid or typhus fevers. Measles caused one death, scarlet fever ten, whooping cough six, diarrhœa five, violence one and consumption 19.

SCOTLAND.—The return of the Registrar-General for the week ending Feb. 17 shows an average rate (annual) per 1,000 of 25.8 in the eight principal towns, which is 3.0 below that of the previous week, but 2.1 above that of the corresponding week of last year. Aberdeen recorded the lowest mortality, 18.1, and Dundee the highest, 29 6. Whooping cough was the most fatal epidemic, the deaths from it being most numerous in Glasgow and Dundee.

Edinburgh.—Deaths 100. Annual rate 22.0. Measles, scarlet fever, diphtheria and diarrhœa caused two deaths each, whooping cough and typhoid fever one death each, acute lung disease 30, and violence five.

PARIS, FRANCE.—For the week ending Feb. 8 there were reported 1,146 deaths; males 609, females 537. Under five years 331; over 60 years 263; annual rate 26.59. Typhoid fever caused 41 deaths, small-pox 15, measles ten, scarlet fever none, whooping cough five, diphtheria and croup 43, dysentery one, erysipelas five, puerperal infection three, consumption 206, acute bronchitis 49, pneumonia 101 and violence 40. The report states that the increased mortality of this week is due to acute bronchitis and pneumonia; the progression of the deaths from the last-named disease has been, during the three last weeks, 79, 95 and 101. The ages of election have been those of pulmonary consumption, to wit: from 15 to 40 years—the ages of force, fecundity and production. This is not the first time that attention has been drawn to this fact.

There remained Feb. 4 under treatment in the hospital 71 cases of small-pox, 466 of typhoid fever and 41 of diphtheria.

During the week ending Feb. 14 there were reported 1,206 deaths, the highest registered during the weeks of the present year; males 661, females 545. Under five years 325, over 60 pears 284. Rate 27.98. Typhoid fever caused 39 deaths, small-pox and measles 14 each, scarlet fever two, whooping cough six, diphtheria and croup 55, erysipelas three, puerperal infection six, consumption 214, bronchitis 33 pneumonia 79 and violence 33. Of the epidemic diseases diphtheria has been most fatal, its mortality figures have increased slowly, but steadily, from 40 during the first week of the year to 55 during the present week.

The numbers remaining under treatment in the hospitals, Feb. 11, were of small-pox 66, of typhoid fever 388 and of diphtheria 45.

RHEIMS, FRANCE.—Consul Jno. L. Frisbie transmits the report for the week ending Feb. 10. Deaths 59; under five years 23, over 60, 14; males 30, females 29. Croup and diphtheria caused three deaths, puerperal infection one, acute bronchitis four, pneumonia five, consumption eight. No deaths are recorded from measles, scarlet fever, small-pox, whooping cough, typhoid fever or violence.

MARSEILLES, FRANCE.—The *Monthly Bulletin* for January reports a total of 1,097 deaths: under five years 346, over 60 years 308; males 615, females 482. There were 1,016 births during the month: males 497, females 519. Of the deaths 39 were caused by typhoid fever, 22 by measles, three by whooping cough, two by scarlet fever, 19 by small-pox, 38 by croup and diphtheria, 123 by consumption, 67 by capillary bronchitis, 64 by catarrh and pulmonary emphysema, nine by congestion of lungs, four by pleurisy, 216 by pneumonia, two by puerperal fever and 23 by violence. Population 369,099.

Digitized by Google

GIBRALTER, SPAIN.—Consul H. J. Sprague reports that from Jan. 13 to date (Feb. 9) 17 cases of small-pox have occurred, resulting so far in four deaths; the remaining cases are reported as progressing favorably.

BRUSSELS, BELGIUM.—During the week ending Feb. 10 there were 191 deaths in the city and its *faubourgs*, equal to an annual rate of 24.2. The births during the same period numbered 268, equivalent to an annual rate of 33.8. Of the deaths 79 occurred in children under five years of age.

Small-pox caused five deaths, measles two, scarlet fever one, typhoid fever three, diphtheria none, croup three, whooping cough three, diarrhœal diseases 16, bronchitis and pneumonia 37 and consumption 23.

ST. PETERSBURG, RUSSIA.—Consul-General Edgar Stanton reports 722 deaths for the week ending Feb. 3; males 406, females 316: under five years 315, over 60 years 73. Population 929.525. Small-pox caused 14 of the deaths and fevers 35.

COPENHAGEN, DENMARK.—There were 119 deaths during the week ending Feb. 6; under five years 56, over 60 years 34. Annual rate 24.76. No deaths are reported from small-pox, measles, scarlet fever, typhoid or puerperal fevers. Diphtheria caused one death, croup three, whooping cough two, diarrhœa five, erysipelas two, consumption ten, pneumonia ten, bronchitis ten, pleurisy one, and violence two.

The following cases were reported during the same period: measles one, scarlet fever 25, diphtheria 13, croup four, whooping cough 54, typhoid fever three; diarrhœa 77, erysipelas 26, bronchitis 928, pneumonia, 70, and tonsilitis, 134.

STOCKHOLM, SWEDEN.—Consul Elfwing reports 97 deaths for the week ending Feb. 3; males 57, females 40; under five years 43, over 60 years 14. Annual rate 29.0. No deaths are reported from small-pox, whooping cough or accidents. Measles caused six deaths, scarlet fever three, puerperal fever one, diphtheria and croup five, typhoid fever one, diarrhœa four, consumption 14, pneumonia 16, and bronchitis seven.

During the week ending Feb. 10 the following cases were reported. Measles 65, scarlet fever 30, erysipelas seven, whooping cough three, diphtheria and croup 12, typhoid fever seven, diarrhœa 19, tonsilitis 20, pneumonia 16, pleurisy three, and acute bronchitis 96.

ROTTERDAM, NETHERLANDS.—Consul Jno. F. Winter reports 104 deaths during the week ending Feb. 17 in a popolation of 157,270. Of the deaths six were referred to small-pox. Twenty-one new cases of this disease occurred during the week.

VIENNA, AUSTRIA.—Consul-General Weaver reports for the week ending Feb. 10, 475 deaths, giving an annual rate of 32.9. Small-pox, measles and typhoid fever caused one death each, scarlet fever two, diphtheria five, whooping cough eight, consumption 126, acute lung diseases 92. The deaths of persons under five years numbered 177.

MADRAS, INDIA.—Consular-Agent L. Strange transmits report for the week ending Jan. 19, showing 361 deaths equal to an annual rate of 39.4; males 140, females 161. Small-pox caused eight deaths, measles three, fevers 64, dysentery 31, diarrhœa 13 and cholera none.

The return for the week ending Jan. 26 shows 305 deaths; males 168, females 137; rate 39.9. Small-pox caused seven deaths, measles three, fevers 76, dysentery 29, diarrhœa 13 and cholera none.

CALCUTTA, INDIA.—Consul-General Mattson reports 350 deaths for the week ending Jan. 20 giving a ratio per 1000 per annum of 42.1 as compared with 36.3 in the previous week. The cholera continues to abate, 47 deaths only having been reported from this cause. The number of deaths from fever amounted to 76, from bowel complaints 64, from tetanus 27, from consumption 10, and from pneumonia five.

BOMABY, INDIA.—Consul B. F. Farnham reports that during the week ending Jan. 30 there were 496 deates registered or 29.34 per thoofand. There were 73 deaths from remittent fever, being 26 less than in the previous week and 22 less than in the same period last year. The deaths from diseases of the respiratory organs, diarrhœa and dysentery were last week 68, 29 and seven respectively as compared with 99, 23, and 14 in the same time last year.

SHANGHAI, CHINA.—Vice-Consul-General F. D. Cheshire reports Jan. 23 that the cases of small-pox among the natives are decreasing in number. A mild type of measles is prevailing among the foreign children.

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

ANTICIPATING a large demand for really first-class — LABORATORY PRODUCTS, — which shall meet the strictest requirements of the New Pharmacopœia, we have greatly increased our manufacturing department.

Our laboratory is in charge of a gentleman of recognized prominence in his profession, and with the command of ample facilities, we can offer a line of preparations that can be implicitly relied on as of the proper strength and purity.

W. H. SCHIEFFELIN & CO.

NEW YORK:
170 and 172 William St.

Pure Sugar
vs.
Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

HAVEMEYERS & ELDER.
DECASTRO & DONNER REFINING CO.

117 WALL STREET,
NEW YORK.

Reliable Food Products.

As the Largest Manufacturers and Dealers in the world in this line, we prefer, and, indeed, we consider it to our interest to manufacture only PURE and WHOLESOME goods, and pack them in a tidy and attractive manner. *All goods bearing our name are guaranteed to be of superior quality, and dealers are authorized to refund the purchase price in any case where consumers have cause for dissatisfaction.* It is, therefore, to the interest of both dealers and consumers to use THURBERS' BRANDS.

H. K. & F. B. THURBER & CO.

West Broadway, Reade and Hudson Streets, New, York.
9 and 11 Fenchurch Avenue, London. E. C., England.
9 Rue Foy, Bordeaux, France.

NOTICE.

Our Canned Goods are put up with a special quality of tin, and most of them, being hermetically sealed while fresh at the sources of supply, preserve the fresh, natural flavors, and are REALLY FRESHER, MORE WHOLESOME AND PALATABLE than many so called "fresh" articles which are exposed for sale during considerable periods of time in city markets.

COOPER,
JONES
-&-
CADBURY,
PHILADELPHIA, PA

WE invite the attention of Architects, Engineers, Builders and those interested in House Construction to the following important features of the

DURHAM SYSTEM OF HOUSE DRAINAGE.

For drains underground we use heavy cast-iron gas pipe, 12 feet long, of *uniform* thickness and *tested* at the works *by hydraulic pressure* (300 lbs). Pipes and fittings are thoroughly protected against rust by Dr. Angus Smith's process. Our joints in cast-iron pipes are the same as gas companies lead joints. Bells of gas pipe are sufficiently thick to permit a thorough caulking in order to obtain a perfectly gas-tight joint. *Our drains are consequently free from leakage of foul water or foul air.*

For soil and waste pipes we use standard, wrought iron, lap welded steam pipe, tested at the works by 500 lbs. pressure, coated with asphalt. This pipe is made in lengths of from 17 to 20 feet, consequently we are enabled to *run from floor to floor without a joint.* Our joints are screw joints made by first-class steam fitters.

Our fittings are of original design, made especially for us, and effectually protected against rust by a coating of asphalt. We decline to sell fittings to be used independently of our knowledge or control. Our Company not only manufactures the materials it uses (except pipes), but it *constructs the drainage system complete, with its own workmen and under supervision of its own engineers.*

For further details call and see full size models at the Office of the Durham House Drainage Company,

187 BROADWAY NEW YORK.

The "EUREKA" Wheel Pipe-Cutter.

☞ If the House of whom you purchase your supplies does not keep it, send direct to us.

The Body—is fitted with an adjustable Cast-Steel Jaw at the point where it comes in contact with the Pipe, which Jaw can be renewed at any time by simply removing one screw. By this system the wearing away of the Jaw (which is other cutters is the first part to give out) is effectually prevented, and this tool can be kept in first-class order at all times.
The Wheel Block—This is also of Cast-Steel, neatly fitted to its socket *and cannot be dropped out.* It is much more durable than the cast-iron blocks and is hardened at the point where the rod comes in contact with it.
The Handle—of this Cutter *is put on to stay*, and cannot be removed by the roughest usage, as it is a hollow iron handle, *cast fast to the Rod*, operating the block.

Manufactured by PANCOAST & MAULE, 243 and 245 South Third Street, PHILADELPHIA, PA.

JENKINS' PATENT

(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

INSIDE VIEW OF GATE VALVE.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not nave to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

A. C. MANNING, 38 Dey Street.

☞ Send for Circular.

ERICSSON'S NEW PAT.

Caloric Pumping Engine

is especially intended for domestic use in lifting and forcing water from wells and cisterns, or from Croton pipes, to tanks on upper floors of buildings in city or country.

This pumping engine is entirely safe, no steam being employed, and is not liable to derangement.

All kinds of fuel will answer for this engine, but coal-gas is preferable, the consumption being only 15 cubic feet per hour. Besides, gas is handier and cleaner than coal or other combustibles. Servant girl can operate it.

Price for 6-inch cylinder, pumping 200 gallons per hour 50 feet: With gas furnace, $210. With coal furnace, $220

Price for 8-inch cylinder, pumping 350 gallons per hour 50 feet: With gas furnace, $260. With coal furnace, $275

Price for 12-inch cylinder, pumping 800-gallons per hour 50 feet: With coal furnace only.....$375

Price for duplex 12-inch cylinders, pumping 1,600 gallons per hour 50 feet; with coal furnace only.....$550

MANUFACTURED BY THE

DELAMATER IRON WORKS,

C. H. DELAMATER & Co., Proprietors,

No. 10 Cortlandt Street, New York City.

Digitized by Google

The accompanying illustration shows the manner in which one of the ROYAL PORCELAIN BATHS was fitted up in the private residence of a gentleman in New York City. The entire floor and surrounding walls were tiled and the Bath was placed sufficiently far from the wall to permit washing every portion of the intervening space. The only wood work used in connection with it was the top rail. In this instance the Bath was lifted from the floor and supported by brass flanges as shown.

These Baths have also been placed in rooms in a hospital in the same manner with the exception that the tubs were set on a floor of flagging and the supply and emptying cocks were placed below the floor, the rods simply running through. The wooden capping, however, was omitted.

Persons living in a house worth over $15,000 should certainly have these Baths, and to be appreciated they should be seen.

It should be borne in mind that the "THE ROYAL PORCELAIN BATH" has been made by one firm exclusively for 27 years, and during all that time they have met all the requirements of a first-class bath.

Mott's Porcelain Lined French Baths,

MANUFACTURED BY

THE J. L. MOTT IRON WORKS,

88 & 90 Beekman Street, NEW YORK.

Shows Bath with Overflow and Waste Coupling—Plug and Overflow Strainer being Nickel Plated and Plug furnished with Rubber Stopper.

Shows Bath with Nickel Plated Cocks, Bottom Supply and "McFarland" Waste Fixtures complete. Fixtures furnished Silver Plated to order.

FIVE SIZES, viz: - - - 4, 4½, 5, 5½ and 6 feet.

The superiority of our Porcelain-lined Baths over all kinds of metal tubs for good work is a well-established fact, as their general use within the last few years throughout the country will prove. Not only are they specially adapted for fine private work, but their durability, cleanliness and moderate price recommend them for general use in Hotels and Public Institutions. The Bath with our Fixtures as shown, is a very handsome, compact and complete arrangement. There are many advantages in the above mode of Supply and Waste, other than its doing away with the lead connections (the entire fixtures being of Brass); for instance, the water is admitted near the bottom of the Tub, thereby doing away with the possibility of servants drawing water and chipping or otherwise destroying the Tub with pails or buckets. Then the Hot and Cold Water is mixed as it comes into the Tub, which prevents the bath-room filling with steam; it also fills the Tub without noise. The "McFarland" Waste makes a very thorough and complete job, and does away with Plug and Chain.

COMPLETE ILLUSTRATED CIRCULARS WITH PRICES, ON APPLICATION.

All our Sanitary Specialties are fitted up with water attached, and may be seen at our Warerooms, Nos. 88 and 90 Beekman Street.

NOTICE.—Correspondents will prevent needless delays and annoyance if they will address all communications, except those of a strictly private nature, to THE SANITARY ENGINEER. Checks should also be drawn to the same order.

PUBLIC HEALTH LEGISLATION.

The present condition of affairs as regards public health legislation in the United States must be a matter of great regret to all who take an intelligent interest in this subject. As regards the National Board of Health, Congress has refused to appropriate any money for its work, and has contemptuously allowed $10,000 for the pay and *personal* expenses of its members, as much as to say, "that is all you are really contending for."

In Pennsylvania, the bill to create a State Board of Health has failed. In North Carolina, the Legislature has refused to appropriate any money for the expenses of its Board of Health.

The unsatisfactory condition of the health section of the Massachusetts Conglomerate Board is well-known to all our readers. It seems evident that our legislators, State and National, do not believe that their constituents take any real active interest in this matter; it is never alluded to in party platforms or the addresses of candidates for office, and they look on it as merely an effort of a few men to create offices for themselves. The fact that the majority of physicians are in favor of health officers and sanitary legislation they explain by saying that the men who want the offices are doctors who have not succeeded in practice, aud that the rest of the doctors will help them out of a feeling of clannishness, etc.

This idea that public health interests are really the interests of a few doctors and sentimental enthusiasts, is one of which the mind of the average congressman will never be disabused until he finds that his actions in accordance with this idea are an obstacle in the way of his re-election, or until the occurrence of a great epidemic creates, under the influence of panic, a public opinion before which he must bow temporarily even while secretly sneering at it.

As regards the National Board of Health it is now necessary for those who have been interested in it and in its work to consider what should be done next. It is to be presumed that most of the present members will at once resign and give the President an opportunity of trying to fill their places with men whose views will be treated with more respect by Congress.

On the whole we are not sure but that it would have been better for the cause of a permanent national health service if the friends of the present Board had permitted the late Congress to kill it outright rather than to have the present starving out policy instituted. It seems that it will require another devastating epidemic with the attendant paralysis of trade, loss of lives and money to awaken a proper public interest in the cause of national hygiene.

REPORT OF THE COMMISSION ON INCREASING THE WATER SUPPLY.

The Commission appointed by the Mayor to examine, in connection with himself, into the best methods of improving the water supply of New York City, made its report to the Legislature on the 9th inst., and endorsed unanimously the plan proposed by the engineers of the Croton aqueduct for a new conduit, built chiefly in tunnel from Croton river to the city.

As to the dimensions of the aqueduct, the commissioners recommend an increase in its size, which, if carried out, will probably increase its cost by about three million dollars, and its capacity by about one hundred and fifty million gallons daily.

As regards the location and size of storage reservoirs, a difference of opinion existed among the Commissioners. This was natural with their limited knowledge and cursory examination. They acted wisely in abstaining from troubling the Legislature with their divergent views on matters concerning which they really knew nothing, and left those questions of detail to those who will be called on to carry out the work.

An excellent recommendation is that which relates to the retention of the Forty-second street reservoir, and its utilization in the proper manner.

It is gratifying to note that the Commission appreciate the necessity of at once instituting measures to suppress the enormous waste of water now prevailing. They advise that power to do this be given to the Department, and that "it be directed to use such power effectively to this end." This is excellent advice, and it is to be hoped that the Legislature will heed it.

Before adequate funds and powers are granted, however, it may require another commission to take testimony and make specific recommendations, since it appears that public confidence in, and support of, any efficient measures, are likely to be lacking, until gentlemen who know nothing of these matters are appointed to take testimony and make recommendations. To professional men this method of procedure seems inexplicable, yet our experience in the matter of the increased water supply indicates that in this community at least, technical matters require the endorsement of laymen.

It is earnestly to be desired that with this report before them, the Legislature will promptly authorize the inception of the great work, and will thus remove the great obstacle which has for

Digitized by Google

several years prevented a succession of incumbents of the Department of Public Works from making any real efforts to stop excessive waste of water. This matter being disposed of, it may be possible for its head to devote his attention to this problem.

NEW YORK'S WATER SUPPLY.

No. IX.

THE SUPPRESSION OF WASTE.

(Continued from page 338.)

Having in preceding articles pointed out what has been accomplished in the way of preventing waste of water by the adoption and enforcement of efficient measures in Great Britain, we will now briefly review the situation in this country. In looking over the field we are bound to admit that, with the exception of two cities, hardly a beginning has been made, though considerable has been said on the subject in print, and a scarcity of supply has forced the consideration of the matter on engineers.

Providence shows the best record of any city in this country so far as the amount of water consumed goes; though it is true the introduction of public water is of comparatively recent date (1870) and from the commencement meters have been in general use. The amount delivered is 32 gallons per head daily, while Milwaukee,* a city of about ten thousand more population, with no special regulations to restrict waste, disposes of 100 gallons per head daily. Such a showing indicates what it is possible to secure by good management.

The following data, for which we are indebted to Mr. Samuel A. Gray, City Engineer, was prepared in response to certain enquiries made by us, and will be found of special interest. It certainly makes a good showing for the meter system.

engines were stopped five days. Had nothing been done to check waste, it will be seen that even this very slender reserve could not have been had, for taking the ordinary increase on the basis of former years' consumption, the original one hundred millions would have been exhausted before the engines were started. After this experience, we imagine the people of Cincinnati will more thoroughly appreciate the value of vigorous waste prevention measures.

In this connection the following data and description of the methods employed may be of interest.

They began the waste inspection with the aid of waterphones the last of November, 1881, although it was not systematically done until July, 1882. The population at that time was estimated at 264,000; it is now estimated at 280,000.

The daily consumption for November, 1881, was 19,706,903 gallons, that being the average for the month. The daily average for January, 1883, was 16,264,000 gallons.

There are employed six men specially on waste inspection and three others at irregular intervals. The annual cost is $5,500.

The method of operation is as follows:

The inspector, with assistant, is furnished a record book, containing the number of house, service stop and location of same, and blank columns for record of inspection, a hydrant key, lantern and waterphone. He begins work at 11 o'clock each night and stops at 4.30 A. M. He reports at office at 8 o'clock the results of night inspection, and then views, or rather inspects, the various premises where running water was detected the previous night. His record of the night work shows him the character of the flow, viz.:

First. Whether it is a large flow or abuse, or a small one or leak.

Second. Whether it is in street or outside of stop, or inside of premises.

If a fitting is found a second time out of order, or, in the judgment of the inspector, it cannot be repaired, it is condemned.

The following was the consumption of water for 1882:

	1881. Gallons.	1882. Gallons.
Total pumpage	8,623,788,320	[illegible]
Deduct injection water for low pressure engines	190,994,220	[illegible]
Deduct differences in coils of reservoir	35,140,000	[illegible]
Total actual consumption of water	8,397,654,200	[illegible]

DAILY AVERAGES.

1882	114,377	5,279	57.39	10,919	269,318.77	3,065,427	32.	48.3	51	100	Water rates reduced
			$2,377.84								

* Yearly balance from the books of the water board: for individual years it is only approximate, as the amounts are not entered until the bills are paid, which is more or less in the following year. The total sum of the six years is very nearly correct, but from this amount also should be deducted some charges which were paid early in 1883. The employés of the meter department are at times called upon to do other work than that actually pertaining to meters, but they do not read the meters.

† The actual number of services in use December 31st, 1882, was 10,357, and the difference between 10,357 and 10,919 should be the number closed, disconnected, etc., since the first service was opened in 1871; therefore, the actual per cent. of services now open, metered to December 31st, 1883, is 51, instead of 48.3 per cent. as above.

All of the above figures include data for 76 miles of pipe supplied with water lying outside of the city limits, with the exception of population and per centage of streets in which pipe is laid, which include only the city proper.

We believe that the scale of water rates is so arranged that most consumers elect to have meters. They find that with care their tax is less than if they pay for each fitting in a building in accordance with the published schedule.

Cincinnati is another place that has accomplished something in reducing the amount of waste, and that seems to be mainly due to the efforts of the authorities, aided by the use of the Bell Waterphone, to discover where abuses existed and waste was occurring.

During the recent flood in that city, it will be remembered, the pumping engines were stopped by the high water, and a very possible calamity averted as the direct results of their waste prevention efforts. It seems that when the pumps stopped there were about one hundred million gallons in the reservoir, and when pumping was resumed there were forty millions left, and the

* From advance sheets of Statistical Tables of American Water Works, by J. J. R. Croes, M. Am. Soc. C. E., M. Inst. C. E.

He first examines for abuses, then visible leaks, after which he tests for underground leaks, and then makes a record, accordingly, opposite the premises. If there is an abuse he leaves a notice to that effect; if a leak he gives a leak notice.

We are indebted to the officials for the following data, which shows the comparative consumption of water (daily average) since 1879:

	January. Gallons.	*February.* Gallons.
1879	15,430,638	15,198,733
1880	15,569,532	15,452,402
1881	18,406,655	19,515,450
1882	17,287,479	17,751,835
1883	16,264,000	15,320,687

The authorities do not presume to regulate, inspect or interfere with the plumbing inside of houses, further than to require defective fittings repaired or replaced. Plumbers are licensed and required to use the regulation service pipes, sidewalk stop and box; otherwise no discrimination is made, except as to hopper closets, which are charged double the usual rates.

The bill introduced into the California Legislature some time since to regulate plumbing in the cities and towns of that State was signed by the governor the 15th inst. The provisions of this law, published in our issue of December 14, 1882, require the registration of all master or journeymen plumbers at the health offices of the several cities and the filing of plans of proposed work. Indeed the California law is very similar to the New York law. By its passage our most Western State gives another evidence of the traditional wide-awakeness of that section of the country.

We print elsewhere two letters by Col. Mendell, U. S. A., transmitted to us by the courtesy of Dr. Sternberg, one referring to the sufferings of cattle from malarious diseases in certain localities, the other to the coincidence of malarious affections with shallow wells. We are always glad to receive communications of this kind, and should be pleased to hear from others of our army readers. Well observed instances of malaria in animals are especially desirable.

We print elsewhere in this issue the full text of Judge Freedman's opinion recently given in the case of the Health Department of this city against one O'Reilly. The suit, which was begun last December, was to obtain a continuation of a temporary injunction restraining the owner from using, leasing or renting a tenement house which had been constructed in violation of the law providing for the proper lighting and ventilation of such buildings. Some of the points of the defense were, that the Board had no right to an injunction, especially since the building was erected before the injunction was sought, and that having granted a permit for the erection of the building they must revoke that permit before commencing suit. The decision is important as being the first written opinion on the right of the Board of Health to injunctive relief in the case

Digitized by Google

of violations of the light and ventilation law. The right to injunction in cases of the violation of the plumbing law is clearly given in the law itself. An appeal from Judge Freedman's opinion has been made and a stay of proceedings granted.

THE ROCKWELL CASE AGAIN.

BUFFALO, N. Y., *Mar.* 6, 1883.

To the Editor of THE SANITARY ENGINEER:

I enclose you a couple of newspaper clippings, also an article copied from the New York *Times*, "Watch the Traps," in which it appears a number of persons died from the effects of sewer emanations in a house claimed to have been fitted in accordance with the *most perfect method of sanitary engineering*.

If such was the case it seems to me that it would have been (or at least should have been) impossible for the sewer air to enter the rooms.

As such published statements have a very damaging effect upon the progress of sanitary plumbing, it would be well if this case were looked into, and a true and correct statement of the manner and condition of the plumbing were handed to the paper that published the account, or else made public through THE SANITARY ENGINEER. It is more than possible that the work (which was done in 1878) was not performed in accordance with the present methods, or, if so done, was slighted in some important detail which rendered the whole work imperfect.

My attention was called last week to the plumbing now being done in one of the largest and most costly dwellings in this city. The owner, I presume, *supposes* he is getting the best kind of sanitary plumbing. The vent pipe from the trap of closet was reduced from 2 inches to 1 inch, and several feet of the 1-inch pipe was run before it entered soil pipe, and the connection with soil pipe was by a putty joint made in a reversed Y-branch. I have no doubt that in the case of the Brooklyn house might be found errors fully as bad as the above.

A well-established refutation of the claim that the plumbing in Mr. Rockwell's house was the most perfect that modern sanitary engineering could devise would do much good and afford great satisfaction to many persons who now consider the money wasted that they have expended on costly sanitary plumbing.

Yours respectfully, EDWARD L. COOK.
16 W. EAGLE ST.

The following are the important parts of the *Times* article:

"In the erection of the building Mr. Rockwell spared no expense to render it perfect in every detail of modern sanitary engineering; but, as appears from subsequent occurrences, altogether in vain. The family had scarcely moved into their new residence, when, in December, 1878, Mr. Rockwell's little granddaughter died of scarlet fever and his grandson barely escaped with life. A couple of months later the old gentleman himself died of diphtheria in its most malignant form. An investigation showed that the traps in the wash-basin and bath-room connected with his sleeping apartments has been disarranged by the pressure of the gas, and that the atmosphere he breathed at at night was loaded with infectious matter. It was discovered also that the house was so situated as to form a sort of ventilatilating shaft for the Furman street sewerage system, standing upon high ground, so that the pipe constituted the apex of the whole network of conduits with which they communicated. The result was that, with the best work in the world, it would have been next to impossible to prevent percolation into the building of the noxious gases of decay. Mrs. Rockwell, the widow, was buried on Saturday, February 24, a sudden attack of pneumonia, the way for which was prepared by the malarious atmosphere, having terminated her life. As the the facts connected with the death of the granddaughter, the illness of the grandson, and the subsequent demise of Mr. Rockwell, are such as to point to infection from the sewage pipes as the cause of the trouble, and as, in some particulars, the case is as typical of sewer-gas poisoning as that described by Dr. Keating, of Philadelphia, recently adverted to in these columns, it is not surprising that medical men have already evinced an interest in its details. It seems clear that there was a relation of cause and effect between the disarrangement of the traps and consequent infection of the house with sewer gas, and the attacks of scarlet fever and diphtheria that so immediately followed. In point of fact, Mr. Rockwell had erected a handsome ventilator for the Furman street sewer, while intending to produce the most perfect piece of sanitary construction in Brooklyn; and through this mistake the beautiful home he had founded was broken up, and three lives were sacrificed to the fetich of that mysterious germ which none but M. Pasteur and Mr. Tyndall have ever yet discovered. The facts of the case should be carefully investigated, and if, as a prominent engineer remarked the other day, tales could be told of the plumbing of our houses of which none yet dream, a new crusade of sanitary science should be set on foot at once. An eminent physician has defined a basin in one's room as a small sewer ventilator located under one's nose, and experience seems to show the justice of the definition.

The report upon the Rockwell Case will be found in this journal for February, 1879, p. 61. a portion of which we quote:

We give herewith the main points of the Brooklyn Board of Health inspector's report on the drainage system of the late Mr. Rockwell's house on Brooklyn Heights, about which such a sensation has been made, presumably because the owner being wealthy, it was supposed his plumbing must be perfect. That his death was the direct effect of the faulty construction of his drain pipes is, after all, merely an assumption. The facts were that Mr. Rockwell's grandchild caught scarlet fever; he nursed her and was taken with it the day after her burial. The seeds of this disease may have come through their unsealed traps, or it may have been caught by exposure to it, no one knows where. That the drainage system, as reported by the inspector, was faulty, no one can deny who has given the matter any attention; but to blame the party responsible for its arrangement would single out one man who, in the light of knowledge then prevailing, did as well as ninety-nine out of every hundred would have done at the time. The house was situated on a superb site overlooking New York Bay, and was believed to be a model in every respect. The plumbing materials were of the best and the workmanship was exceptional. The Board of Health inspector, however, states, that while the main lines of soil pipe were continued to the roof, some of them were also used as rain-water leaders.

"One of these received the rainwater from 1,200 square feet of roof, and during heavy rains was so filled with water as to empty every trap connected with it. It was to this pipe that the water closet in Mr. Rockwell's bath room was connected.

"The water pipe connected with the wash basins in Mr. Rockwell's sleeping room on the second floor and the nursery and sleeping rooms on the third floor were not carried to the roof, nor were the traps ventilated. The traps on this line of waste pipe were not only syphoned by their own use, but the use of a basin on the third floor would empty one below and *vice versa*. The waste pipe connected with the butler's sinks on the kitchen and parlor floors was not carried to the roof, and these traps were also syphoned. There was no trap cutting off the house from the public sewers. Lastly, a tank on the top floor had its overflow pipe connected with the soil pipe, and analyses of its contents showed organic impurities."

Mr. Rockwell's drain pipes dropped almost perpendicularly down a steep hill with a fall of 50 feet, and there entered into an old sewer believed to be defective. Hence special facilities were offered for foul gases to enter the house. This work was executed five years ago, and so far as the plumbing was concerned, it was honestly and faithfully done; but the plumber had no discretion in the arrangement, and the responsibility rests with Mr. Rockwell and his architect who made the plans and had their ideas carried out, the plumber being in no way consulted.

It should be borne in mind that this work was done in 1875, since which time much has been learned.

So far as the scarlet fever is concerned, it is in the highest degree improbable that the plumbing arrangements had anything to do with it.

However this may be, the fact that bad results follow from improper plumbing does not prove that there is any danger connected with good and properly arranged plumbing.

What the writer in the *Times* means by the statement that "three lives were sacrificed to the fetich of that mysterious germ which none but M. Pasteur and Mr. Tyndall have ever yet discovered," we do not know. If it is intended to throw doubts on the existence of a germ as the cause of diphtheria and scarlet fever, it does not follow from the facts cited. Meantime it seems to us that the writer should consider what the results of his attacks on sanitary pumbing will be if successful, and endeavor to discriminate between good work properly planned, bad work on good plans, and good work on bad plans.

HOW TO MAKE A PLACE UNHEALTHY.

In the first place no means should be used to prevent the spread of contagious, infectious and pestilential disease. If you have small-pox in the house carefully conceal it. If it were known to exist there, especially if you keep a grocery, a meat market or a saloon, and live in the same building, it might hurt your business. If your family doctor calls it small-pox, look daggers at him, and suggest that his services are no longer needed. Threaten him with all the calamities of your unbridled displeasure, if he dares to report, especially to the diabolical board of health, that there is a case of small-pox in your household. If the health officer comes around to interfere threaten him with a mob. If any movement is made to prevent the spread of the disease by vaccination, the town board or common council has a fine opportunity of showing its appreciation of public economy by refusing to make an appropration of tax-payer's money for any such purpose, and if the Anti-vaccination Society sends you a tract, read it carefully and swallow its nonsense as gospel. In due time the loathsome disease will break out all around you in the neighborhood, and will be multiplied in your own family. Then denounce the public authorities for neglecting to protect the people.

In the second place, conditions of filth abound everywhere, which may be utilized for the purpose of making a place unhealthy. All households furnish organic refuse in great abundance, which it requires no effort, nor even intelligence, to so dispose of as to produce the maximum amount of health-destroying poisons. Fortunately, in resisting the encroachments of sanitarians, it is a good deal easier, much more in accordance with the inclinations of human laziness, to leave decaying vegetables in the cellar all summer, than to remove them to a distant compost heap. The cellar windows should be closed to keep out the wind, rain and cold. This valuable source of making your habitation unhealthy may be increased by neglecting to drain the site. If the cellar occasionally half fills with water, in a season of rain, and rotting potatoes, turnips and cabbages float around in it, especially if you have to wade in it to get at the butter tub, milk pans and pork barrel, the means of unhealthiness will be greatly improved, although not yet perfected. If you live in town you can have a big untrapped wooden box, or porous cement pipe, running from six or eight inches above the bottom of the cellar to an unclean brick sewer in the street, through which great volumes of putrefactive gas, laden with invisible vermin called bacteria, perhaps with the germs of contagious disease from neighboring premises, can freely enter there to mingle with the malaria already formed, and flow up through all the living rooms of your habitation. In the winter bank up your house, and allow no portion of the foul air to escape into the outer air, or any pure air from without to get in. Manure is a good material for such a purpose. The fires started when the cold weather comes will make the house itself act as a funnel to draw upwards the poisonous exhalations from the bottom. Only one thing more is wanting to make the arrangement complete; if you live in town, you can have an unventilated water closet, in some dark interior part of the house, with imperfectly jointed or cracked soil pipe, the sulphuretted and carburetted hydrogen gas from which will give the finishing flavor to the atmosphere of your dwelling.

Having thus secured air best adapted to make your home unhealthy, you should also provide an abundance of commendably unwholesome water. The task is not a difficult one; it requires no scientific knowledge and not an unusual amount of intellect. If you live in a city, be sure and help elect officers who will take the public water supply from a source near by, and probably polluted with sewage, in order to save a little expense. If you live in the country, you can make a group of the barn yard, hog pen, dog kennel and back-house, with the well in the centre. Never remove the manure from the outhouses. Dig a great hole in the ground for a privy vault, and in it treasure up the vilest excreta for years. If the vault at length becomes full, throw a little dirt over it and dig another hole. Through the porous earth the putrescent mass will slowly drain to the well, in which hangs "the old oaken bucket." In Northern Scotland, as late as the sixteenth century, the people would dig up a corpse, cut off the head, soak it in a bucket of water, and then drink the water as a cure for witchcraft. They called it "dead bree." You have provided a still more potent "dead bree" in the water of your well. Several tons of foul, putrid excrement near by it, may safely be regarded as more poisonous than a whole graveyard full of corpses. The adjacent heaps of the excreta of cattle, swine and dogs are not of equal unsanitary value, but they are effective adjuvants. Use the water long enough and it will cure you and your household, not only of witchcraft, but of all other mundane ills. If the sanitary busy-body says anything about your fine well, show him the clear, cold, sparkling water, and laugh at his moonshine about chemistry and the microscope. Remind him scornfully that the evidence of your unaided senses is better than all his newfangled science.

If would probably be superfluous to give any directions how to add unwholesome food to impure water and foul air.

If, under such combined influences, you and your family become sick with malarial, typho-malarial or typhoid fever, diphtheria, dysentery, or other filth disease, and your doctor should look around your premises for the cause, admonish him that he has been sent for to give medicine and to cure, and not to meddle with private affairs and question Providence. The kitchen slops thrown on the ground, under your sick room window, there putrefying in the summer sun, may subject you to the temporary inconvenience of closing the window, to shut out the rank odor and the green flies, already ominous of the inch-long banqueters that, sooner or later, feast on the remains of all. A stink is nature's emphatic and rather frank opinion of filth, but never mind her voice, for she may be in collusion with the unregenerate sanitarian.—DR. O. W. WIGHT, *to the Sanitary Convention at Pontiac, Mich.*

WARMING AND VENTILATING THE OPERA HOUSE AT OGDENSBURG.

We illustrate this week the warming and ventilating of the new Town Hall at Ogdensburgh, in the town of Oswegatchie, N. Y.

The building though known by the name of "Town Hall," is in reality the municipal building, jail, town hall and opera house combined.

The auditorium of the theatre is 60 feet wide by 68 feet long and 50 feet high with two galleries, and will seat 976 persons.

The stage at the curtain is 35 feet wide and 40 feet deep with a height of 60 feet.

The system of warming is by direct and indirect radiation combined, and the ventilation is produced by a *vacuum movement;* aspirating shafts exhausting the air at the levels of the floors and ceilings of the main floor and galleries.

In cold weather the aspirating shafts are assisted by the natural condition produced by the dense cold air forcing its way to the inlet ducts.

The warmed air in winter and the fresh air in summer is admitted at 144 places through the auditorium floor (see arrows). These openings are nine inches long by three inches wide with registered faces set into them, having an aggregate area of 20 square feet of openings.

The fresh air is taken in at the side of the basement (marked *air* on basement plan) and drawn down through a short shaft; from thence it is delivered to the large boxed coils.

The warm air from these coils is then passed between every third joist (which radiate and slope out and upward from the stage) and is delivered through the risers of the steps, upon which the seats are fastened.

The space between the joists through which the warmed air is drawn is lined with a heavy tin casing, flanged through the risers, before the register faces are inserted. A detail of how this is done can be seen in the perspective drawing.

The direct radiation is by long coils placed along the outside walls and under the windows of the main floor and gallaries, to prevent downward cold currents at the walls.

The aspirating shafts have an area in cross-section of 37 square feet. The shaft *c* is warmed by a box coil, placed just above the level of the first gallery, the coil being made to fit the space, so that the air in its upward movement would all have to come in contact with the hot pipes. The shaft on the other side of the building is warmed by the smoke pipe from the boilers passing through its whole length.

The obstruction to the shafts caused by the heating surfaces, reduce their capacity to about 30 square feet. Six registers 21 inches by 29 inches open into each of these shafts, giving an area, when allowance is made for the fretwork, of about 35 square feet.

We are told the velocity of the air at the registers will average 420 feet per minute, which must be equivalent to the moving of the air once every 14 minutes, or about 14 cubic feet of air per person per minute.

In addition to the aspirating shafts, there is in the centre of the ceiling, over the chandelier, an arrangement of nicely disguised openings, aggregating 50 square feet. The air in its escape through these openings is controlled above the ceilng by trap doors operated from the wings.

The stage is warmed entirely by direct radiation, the surface being very large and divided into sections, with a view to keeping the stage and the auditorium at as near the same temperature as possible.

Each private box has its own warm air register, and there are two large direct radiators under the front of the stage, the air circulating from the auditorium in and out again through fretwork.

The Town Hall, 64 feet by 48 feet by 34 feet on the second floor is warmed by three direct radiators and by four indirect radiators, with the air delivered in six places.

The four principal offices on the first floor are warmed by indirect radiation, and the rest of the building, including halls and jail by direct radiation.

Steam is furnished by three of the "Nason" sectional steam generators, two of them being always sufficient for the building, with one in reserve.

The apparatus is what is known as a "Gravity Return" and will work at all pressures.

The size of the mains is shown in the basement plan with the warming of the green room and dressing rooms, which is done overhead.

Other details may be gleaned from a study of the diagrams.

The architect of the building was G. A. Schellenger of New York.

Charles Lavier was the contractor, the work being done under the direction of William J. Baldwin.

It now seems likely that Columbia College will, before very long, provide a special course in sanitary engineering. President Barnard has recently stated that without doubt such a course would be established; "it was a subject of the greatest importance, and one which was felt to be a growing necessity in the institution, as well as by the friends of the institution."

Rats are usually regarded an unmitigated nuisance and destroyers of all plumbing work softer than iron, but Prof. Huxley, in an address before the London Sanitary Protection Society, represented them in the light of sanitary pickets, or inspectors; where a rat could come through, there, certainly, bad air could find entry. He related a case in his own house, where complaint of rats in the basement led to an investigation which showed that the workman who laid a drain under the house had not closed a joint where there was a change of direction, and this had existed for years unsuspected until the appearance of the rats led to its discovery.

Another instance, similar to those we have recently noticed, showing that bad air from heating apparatus is sometimes due not to what the heating men propose, but to what the house occupant disposes, is reported from Chicago. A terrible stench was observed in the Chamber of Commerce building in that city, and an officer of the Board of Health was summoned to find the sewer gas. It was discovered in the heaters where the "bulls and bears" had thrown cigar stumps and spit tobacco juice.

The existence of wells exposed to inevitable pollution is likely to involve Brooklyn in a suit for damages. One John Danaher claims $10,000 for the loss of two of his sons, who, he says, died from the effects of drinking the water of one of the wells. The Commissioner and Dr. Bartley, consulting chemist, for now nearly a year have waged war on these wells, and have closed some thirty of them. His suit will unquestionably bring the City Government to see the necessity of backing up the Health Department more vigorously than ever.

Owing to the accumulation of plumbing and steam heating articles, we have been obliged to omit this week the conclusion of Dr. J. S. Billings' lecture on "Germs and Epidemics."

The total number of houses inspected by the officers of the Sanitary Protection Association during the year 1882 was 362. Of these 21, or 6 per cent., were found to have their drains entirely choked up, and no communication whatever with the sewer; all the foul matter sent down the sinks and soil-pipes simply soaking into the ground under the basement of the houses. In 117 houses, or 32 per cent., the soil-pipes were found to be leaky, allowing sewer gas, and in many cases liquid sewage, to escape into the house. In 137, or 37 per cent., the overflow pipes from the cisterns were led direct into the drains or soil pipes, allowing sewer gas to pass to pass up them, and contaminate the water in the cisterns, and in most cases to pass freely into the house. In 263, or nearly three-fourths of the houses inspected, the waste pipes from baths and sinks were found to be led direct into the drain or soil pipes, thus allowing the possibility of sewer gas passing up them instead of being led outside the house, and made to discharge over trapped gullies in the open air, as they should be.—*The Engineer.*

A DECISION AFFECTING TENEMENT HOUSES.

The following is the text of the decision of Judge Freedman of the Superior Court of New York City in the action of the Board of Health against Thomas O'Reilly, to restrain the latter from occupying or renting a tenement house until it be made to conform to the provisions of the law respecting such buildings.

SUPERIOR COURT
OF THE CITY OF NEW YORK.

THE HEALTH DEPARTMENT OF THE CITY OF NEW YORK, and another, *against* THOMAS O'REILLY. } *At Special Term.*

Freedman, J.

If the determination of the question whether upon the facts of this case the plaintiff can maintain an action for injunctive relief, depended solely and exclusively upon the language of the statute for the regulation of tenement and lodging houses (ch. 908 of Laws 1867, as amended by ch. 504 of Laws of 1879 and ch. 399, sec. 1 of Laws of 1880), I should not hesitate to hold that the action does not lie, because the acts complained of were for the first time rendered unlawful by the reason of the passage of said statute, and the statute provides for violations of its provisions certain specific remedies which do not include an action for injunctive relief. It is well settled as a general rule that where a statute creates a new offense by making unlawful what was before lawful, and prescribes a particular penalty and mode of enforcing it, or where a statute creates a new right and prescribes a remedy, the statute must be followed, and anyone who attempts to inflict such a penalty, or to enforce such a right, must do so as directed by the statute. But the question always is first of legislative intent and every general rule may have an exception.

The statute applicable to the case at bar constitutes only one of a series of legislative enactments conferring powers upon, and defining the duties of, the Health Department, and as such it must be construed in connection with the other statutes upon similar subjects, and the general grant of powers conferred by the latter. When thus construed it will be found not only that the Health Department has general power to sue and be sued, but also that under ch. 956 of Laws of 1867 it is authorized to institute and maintain a suit for the abatement or remedying of a nuisance; that the word nuisance as used in said act, embraces every public nuisance as known at Common Law or in Equity Jurisprudence, whatever is dangerous to human life, or detrimental to health, whatever building or erection, or part or cellar thereof, is overcrowded with occupants, or is not provided with adequate ingress or egress to or from the same, or the apartments thereof, or is not sufficiently supported, ventilated, sewered, drained, cleaned or lighted, in reference to their or its intended or actual use, and whatever renders the air or human food or drink unwholesome, and that in a suit for the abatement of any such nuisance, injunctive relief may be granted.

Moreover, it will be found that under Chapter 636 of Laws of 1874 the Board of Health may institute and maintain, in the name of the Health Department of the City of New York, all such suits and proceedings as may be reasonable, necessary and proper for recovering any moneys expended, enforcing any lien or the payment of any fine, the punishment for any offense, or in other respects carrying out the provisions of the law under which it acts.

These powers are quite sufficient to enable the plaintiff to maintain the present action, especially as it is alleged in the complaint, and the proof shows that defendant's tenement house was not only built in violation of the law, but also that it will be deleterious to the health and comfort of the occupants thereof, and that there is no adequate remedy at law to prevent the injurious consequences.

The defendant obtained a permit from the plaintiff for the erection of a five-story tenement house, upon the representations that the size of his lot was 25 x 100 feet, that the size of the building to be erected thereon for the purposes of a tenement house would be 25 x 60 feet, and that there was no additional structure upon the said lot and premises, and the permit was issued to him upon the express condition that no additional structure should be placed upon the lot, except upon plaintiff's approval and a special permit.

The representations were untrue, inasmuch as at the time they were made there was upon the rear part of the lot a three-story building running back to within two feet of the rear line of the lot, and the permit and the statute were violated because the defendant, though he cut the said three-story building down to one containing only one story, left between it and the rear wall of the five-story tenement house a space of only about four feet. Aside from the permit the statute expressly provides that in such a case there must be a clear open space extending upwards from the ground, of at least ten feet between the buildings; and that no house, building or portion thereof shall be used, occupied, leased or rented for a tenement or lodging house unless the same conforms in its construction and appurtenances to the requirements of the statute.

The plaintiff is entitled to judgment: 1. That until the distance between the rear wall of the tenement house to the front wall of the rear building shall, in all respects, have been made to conform to the requirements of the Statute, the defendant and all persons claiming under him and his agents and servants, be enjoined and restrained from using, occupying, leasing or renting the said tenement house, or any part thereof, for the purposes of a tenement or lodging house; and 2. That the plaintiff recover the costs of the action.

DETAIL ILLUSTRATING METHOD OF ADMITTING WARM AIR TO AUDITORIUM.

A COMPETITION OPEN TO JOURNEYMEN PLUMBERS AND GAS FITTERS.

A good thing is done by Mr. T. J. Byrne, a plumber of this city, in his offering three prizes to journeymen and apprentices for the best essays on certain subjects connected with their trades. A gold medal is to be awarded to the journeyman plumber or apprentice who designs the best set of drawings of the plumbing of a building or dwelling; a silver medal to the journeyman plumber or apprentice who writes the best essay on sanitary plumbing, and a bronze medal to the steam and gas fitter or apprentice who prepares the best essay on gas fitting and steam heating, with drawings.

The Hydraulic and Sanitary Plumber, of which Mr. Byrne is one of the editors, publishes the terms of the competition, which are as follows:—

1st. The gold and silver medals to be open to every journeyman plumber and apprentice. No one not an accredited journeyman or apprentice will be qualified.

2d. The bronze medals to be competed for only by gas fitters and steam heaters and apprentices, and no one else.

3d. The drawings must be made by the person whose name accompanies the work. The essays to be thoroughly original, and to be in the handwriting of their respective authors.

4th. Competition will be open until September 1, 1883, after which the date entries will close.

5th. A drawing will be made only upon one side of the paper. Copy to be written only on one side of the sheet. Black ink to be used in all cases.

6th. All drawings and essays intended for competition should be addressed "Personal" to the "Editor of *The Hydraulic and Sanitary Plumber*." In one corner and on the face of the envelope, should be marked clearly, to prevent confusion, "Prize Drawing" or "Prize Essay," whichever it may be. Particular attention should be paid to this clause, as matter coming to us not marked "Prize Drawing" or "Prize Essay," will be regarded as for the paper, and will be treated accordingly.

7th. All prize communications must be signed with a fictitious name. The writer's real name must be written on a card with his fictitious name written underneath. This measure is taken to insure fairness in decision, and prevent confusion in signatures—fairness in that no one shall see or know the real author but the editor of the paper until the decision is made; confusion in that several persons may adopt the same signature.

The judges will consist of Master Plumbers of New York, Brooklyn, Jersey City and Chicago. Decisions shall be made by the first of October, or as nearly thereafter as practicable. The winning designs and essays to be published in *The Hydraulic and Sanitary Plumber*, together with such other essays worthy of especial mention by the judges.

Correspondence.

SYPHONAGE OF THE MAIN TRAP.

BOSTON, *March* 1, 1883.

To the Editor of THE SANITARY ENGINEER.

In answer to your correspondent "W." let me say, it was not intended that any printed report, at all, should appear, of my paper, as the whole sum and substance of it was likely to be published more fully in detail for general circulation, in a few weeks.

While it is true that the running trap at times is syphoned, yet it was not the aim of the paper to point out this fact other than casually, but rather to call attention to the frequent *forcing* of running traps, by back pressure, and the disagreeable "puffing" of fresh air inlets, and the possible danger of transmitting contagious diseases in this way.

Technical letter press is apt to be somewhat confused when reprinted, and if taken down originally by a reporter, may not be strictly according to fact, in the first instance; if "W" will wait patiently a few weeks he shall be furnished with a printed copy of what was actually stated, which I trust may be less involved and more interesting.

Very truly, ERNEST W. BOWDITCH.

HEATING A TANK.

DETROIT, MICH., *March* 6, 1883.

To the Editor of THE SANITARY ENGINEER:

A circular tank with flaring sides measuring 4' 3" on bottom, 3' 7" on top and 3' 8" perpendicular height, is used here by laundry for washing purposes. It stands on roof and is housed in. It is supplied by city water, which runs in over top connected with ball and cock. At present it is heated by steam. Wish to do away with steam and heat by stove and coil or some other hot water apparatus. From bottom of tank to floor directly beneath, upon which

the stove will stand, is 13' 6". What or how much heating surface in coil is needed to heat this tank full twice a day to 200° F.? An early answer in your paper will greatly oblige A SUBSCRIBER.

[Your tank will hold about 2,800 pounds of water, which if warmed from 40° to 200° F. (twice in ten hours) will require 896,000 *heat units*—89,600 *heat units* per hour; equivalent to the evaporation of about 1½ cubic feet of water per hour. A greenhouse boiler of from 25 to 30 square feet of surface will do. Connect it as shown in diagram.]

ARTESIAN WELLS IN NEW YORK CITY.

NEW YORK, *March* 9, 1883.

To the Editor of THE SANITARY ENGINEER:

Please give me some information, through the columns of your good paper, regarding any artesian wells that have been sunk on Manhattan Island, such as their number, location, depth, and character of the water. W.

[In THE SANITARY ENGINEER of Oct. 12, 1882, (Vol. VI. page 401) it was stated, on the authority of Mr. C. W. Marsh, that there were 46 bored wells on Manhattan Island, varying in depth from 26 to 2,000 feet, 18 being more than 500 feet deep. The diameter was stated to vary from 2½ to 10 inches, the majority being 6 or 6½ inches, and the capacity to range from 2,000 to 126,000 gallons per day. The temperature of the water, so far as noted, was between 50° and 59° F. We believe the number at present is somewhat greater than this—in the neighborhood of 60, we think. A large proportion, if not the majority, are found at the breweries, where the water is used for cooling on account of its lower temperature than the Croton. The most extensive borings, we believe, have been made at Ehret's, 92d street and 3d avenue. Dr. C. F. Chandler is authority for the statement that the water from such wells can never be free from danger if drank before being boiled. The geological formation renders it impossible, he says, for water to come in from beyond the limits of the island, except, possibly, in one locality for a short distance south of the Harlem river. It is only filtered surface water, he says, and however clear it may be, it is always in danger of containing disease germs which cannot be filtered out by the soil.]

PIPES FROM WATER CLOSET RECEIVERS.

To the Editor of THE SANITARY ENGINEER:

I notice that you often recommend running the vent pipes from receivers of water closets to heated flues, and publish descriptions of work where such system is indicated. I suppose by heated flues are meant usually chimney flues, and I would like to inquire whether this practice is not attended with some risk. If the pipes from several water closet receivers on different floors were run, as would likely be the case, into the same heated (chimney) flue, and that flue had, as is also likely to be the case, another opening, fireplace or stove pipe hole, beside that from kitchen range, usually relied on to keep it hot, then there would be the risk of the accumulated bad air from the receivers coming out at that opening; especially in case of reversals of the draft, which you have frequently called attention to.

Therefore, I would suggest that the direction to run pipes from receivers to heated flues should be so qualified as to mean to flues heated by gas jets or otherwise, for that special purpose, or if to a chimney flue then to one which has no opening above the basement.

Yours, very truly, H. V. D.

[Your suggestion is a pertinent and proper one.]

DOUBLE BOILERS.

To the Editor of THE SANITARY ENGINEER:

Will you kindly give me your opinion on the statement and plan of the fitting of a private mansion. I intend fitting the house up double from street and tauk. It is a four story building, there being on the top-floor a sink, the third floor, bath, closet and wash basins, and on the second floor the same, on first floor boiler sink. I would like to have it so arranged that in case the water does not raise to the second story, by means of a cut off. I can supply from tank on plan of a double boiler, the two lower floors to be supplied from street pressure. Hoping that you will give me your idea of the same in your next issue. I remain,

A Constant Reader of THE SANITARY ENGINEER.

Will you please give me the name of a good book on plumbing and also the price.

[You will find a description and illustration of the manner of fitting up a double boiler in an article by "Sanitas," page 288, issue of May 15, 1881. The cut-off is shown on page 303, issue June 1, 1881. The description of the work in the houses of Messrs. Bishop, Sloane, Vanderbilt and others that appeared in THE SANITARY ENGINEER last year, will also give considerable information on this point. The publisher of this paper sells several books on plumbing but we know of none that describe the double boiler system as practised in this city aside from the bound volumes of THE SANITARY ENGINEER.

The following books are on plumbing: The Plumber and Sanitary Houses (Hellyer), $4.00; Lectures on the Science and Art of Sanitary Plumbing (Hellyer), $2.00; and Mr. Paul Gerhard's, House Drainage and Sanitary Plumbing, $0.50; On drainage, Mr. E. S. Phillbick's American Sanitary Engineering, $2 00.]

To the Editor of THE SANITARY ENGINEER:

I would like to call your attention to this statement by an architect who furnishes to a Western board of health a plan and description of plumbing as he does it. He says:

"None of the traps are ventilated, as I do not consider it essential, except when necessary to prevent syphonage."

Now I would like to ask, what conception this architect can have of the requirements of plumbing to qualify him to instruct the public? W.

["We give it up."]

VERTICAL CHECK-VALVE.

NEW YORK, *March* 8, 1883.

To the Editor of THE SANITARY ENGINEER:

In placing a check-valve on the supply pipe from a house tank, as arranged in the drawing of John Newell, in your issue of Dec. 7, 1882 (vol. VII. page 9), would it not be better to take the pipe down first and then turn it back like a half S-trap, as shown in the accompanying sketch, so that a vertical check may be used, as at *C*? Is not a vertical check less liable to get out of order than a horizontal one? B.

[We think it is, though if a trap like this be used, a trap screw should be put in so that the water could be drained out, in case the tank was emptied or there was a liability of freezing or stoppage from sediment.]

SEPARATE SYSTEM OF SEWERAGE.

LAWRENCE, *March* 7, 1883.

To the Editor of THE SANITARY ENGINEER:

Is there any recent work on the "Separate System of Sewerage" giving method of calculation for sizes of mains, etc. I have seen a notice of a "Diagram for Sewer Calculations," by W. P. Gerhard, published by Spon, represented as indispensable to those about to adopt the separate system. Can you tell me anything as to the value of this work? A reply to this at your earliest convenience would be gratefully received. Yours, A. D. MARBLE,
City Engineer.

[There is no book, so far as we know, giving the mode of computing sizes of sewers specially for what is called the separate system. The publications concerning this "system" have been chiefly devoted to general argument. Any table of the flow of water in pipes or sewers will do for this purpose, by making the proper allowance for the proportion of quantity discharged to the area whence it is derived. Where rain water is excluded from sewers, the maximum flow to be provided for may be assumed in a closely built up street in a town with a copious water supply to amount to three cubic feet per minute for every thousand linear feet of street sewered. For practical reasons the smallest sewer used so far has been of six inches diameter, and this may be considered the limit of size. The smallest amount provided to be removed, if rainfall is admitted to the sewers, has been assumed to be equivalant to a rainfall of one-fourth of an inch per hour, which, on 1,000 linear feet of street, 60 feet with lots 100 feet deep fronting on it, would amount to a flow of 90 cubic feet per minute. Any table of sewer sizes, computed for taking in rainfall, may be used for obtaining the sizes of separate sewers by assuming the quantity to be disposed of as one thirtieth of that allowed for in the tables.

The diagram mentioned is a very convenient one for sewer calculations of any sort, and it is believed to correctly represent the results of one of the best formulæ for flow in pipes.]

PLUMBING LAW VIOLATIONS.

Nine violations of the plumbing regulations were reported at the Health Department of this city during the past week—all of a trivial nature—as follows: By Inspector Hollick three, and by Inspectors Eagleson, Golden and Hooper, two each. No cases proving to be of a serious nature were reported. No cases were submitted to the attorney.

Inspector Berry reported three violations of the light and ventilation law—all consisting of failures to submit plans.

The New Orleans "*Times-Democrat* Almanac" for 1883 is compiled especially for Southern readers to whom its commercial and political information concerning the Southern States will be of much use. It is well illustrated, has much carefully selected general information, and will be welcomed at a counting room desk or a family table.

THE BOSTON PLUMBING ORDINANCE.

The following is the text of the ordinance regulating plumbing in the city of Boston, which passed the City Council the 16th inst., and has received the Mayor's signature. We defer editorial comment until our next issue.

"SECTION 1. No person shall carry on the business of plumbing unless he shall have first registered his name and place of business in the office of the Inspector of Buildings, and notice of any change in the place of business of a registered plumber shall be immediately given to said Inspector.

"SECT. 2. Every plumber, before doing any work in a building, shall, except in the case of repairs or leaks, file at the office of the Inspector, upon blanks to be provided for the purpose, a notice of the work to be performed; and no such work shall be done in any building without the approval of said Inspector.

"SECT. 3. Every building shall be separately and independently connected with the public sewer, when such sewer is provided; and, if such sewer is not provided, with a brick and cement cesspool of a capacity to be approved by the said Inspector.

"SECT. 4. Drains and soil-pipes through which water and sewage is used and carried shall be of iron, when within a building, for a distance of not less than five feet outside of the foundation walls thereof. They shall be sound, free from holes and other defects, of a uniform thickness of not less than $\frac{1}{8}$ of an inch for a diameter of four inches or less, or $\frac{5}{32}$ of an inch for a diameter of five or six inches, with a proportional increase of thickness for a greater diameter. They shall be securely ironed to walls, laid in trenches of uniform grade, or suspended to floor-timbers by strong iron hangers, as the said Inspector may direct. They shall be supplied with a suitable trap, placed, with an accessible clean-out, either outside or inside the foundation wall of the building. They shall have a proper fall towards the drain or sewer, and soil-pipes shall be carried out through the roof, open and undiminished in size, to such height as may be directed by said Inspector; but no soil-pipe shall be carried to a height less than two feet above the roof. Changes in direction shall be made with curved pipes, and connections with horizontal pipes shall be made with Y branches.

"SECT. 5. Rain water leaders, when connected with soil or drain pipes, shall be suitably trapped.

"SECT. 6. Sewer, soil-pipe or waste-pipe ventilators shall not be constructed of brick, sheet-metal, or earthenware, and chimney-flues shall not be used as such ventilators.

"SECT. 7. Iron pipes, before being put in place, shall be first tested by the water or kerosene test, and then coated inside and out with coal-tar pitch, applied hot, or with paint, or with some equivalent substance. Joints shall be run with molten lead and thoroughly calked and made tight. Connections of lead pipes with iron pipes shall be made with brass ferrules, properly soldered and calked to the iron.

"SECT. 8. Every sink, basin, bath-tub, water closet, slop-hopper, and each set of trays, and every fixture having a waste-pipe shall be furnished with a trap, which shall be placed as near as practicable to the fixture that it serves. Traps shall be protected from syphonage or air-pressure by special air-pipes of a size not less than the waste-pipe; but air-pipes for water closet traps shall be of not less than two-inch bore for thirty feet or less, and of not less than three-inch bore for more than thirty feet. Air-pipes shall be run as direct as practicable, and shall be of not less than four-inch bore where they pass through the roof. Two or more air-pipes may be connected together or with a soil-pipe; but in every case of connection with a soil-pipe, such connection shall be above the upper fixture of the building.

"SECT. 9. Drip or overflow pipes from safes under water closets and other fixtures, or from tanks or cisterns, shall be run to some place in open sight, and in no case shall any such pipe be connected directly with a drain, waste-pipe, or soil-pipe.

"SECT. 10. Waste-pipes from refrigerators or other receptacles in which provisions are stored, shall not be connected with a drain, soil-pipe, or other waste-pipe, unless such waste-pipes are provided with traps, suitably ventilated, and in every case there shall be an open tray between the trap and refrigerator.

"SECT. 11. Every water closet, or line of water closets on the same floor, shall be supplied with water from a tank or cistern, and the flushing pipe shall not be less than one inch in diameter.

"SECT. 12. Pipes and other fixtures shall not be covered or concealed from view until after the work has been examined by the said Inspector, and he shall be notified by the plumber when the work is sufficiently advanced for inspection.

"SECT. 13. Plumbing work shall not be used unless the same has first been tested by the said Inspector with the peppermint, ether, or water test, and by him found satisfactory.

"SECT. 14. No steam-exhaust shall be connected with any soil or waste pipe, or drain which communicates with a public sewer.

"SECT. 15. Water pipes in places exposed to frost shall be packed with mineral wool, or other substances equally good, and they shall be cased to the satisfaction of the said Inspector.

"SECT. 16. A grease trap shall be constructed under the sink of every hotel, eating house, restaurant, or other public cooking establishment.

"SECT. 17. The provisions of Sections 3-13, inclusive, and of Section 15 of this ordinance, shall apply only to buildings erected, or to work performed, after its passage."

NOTES FROM CHICACO.

[From our Special Correspondent.]

The semi-monthly meeting of the Master Plumbers' Association of Chicago, held Thursday evening, March 15, was presided over by David Rock, T. C. Boyd, Acting Secretary. About thirty attended, and unanimously approved the following two committee reports:

"Your Committee appointed for the purpose of taking measures towards forwarding a correspondence with our fellow tradesmen in New York, met at the rooms of the Master Plumbers' Association on Tuesday, March 12, at 2 P.M., and adopted the following resolutions:

"I. That the Master Plumbers Association of the City of Chicago are in hearty sympathy with all movements that shall be taken to advance the interests of our fraternity.

"II. That a national society should be organized as soon as possible.

"III. That the Corresponding Secretary be instructed to correspond with the New York Master Plumbers' Association, informing them of our progress as a Society.

"IV. In order to bring to a closer relationship the Master Plumbers doing business in surrounding towns tributary to Chicago, we, the Committee, desire that the Corresponding Secretary be instructed to invite them to become members of our Association."

The second approving vote was on the following sensible and timely card to the public:

"The Sanitary Committee respectfully suggest to our citizens that now is the proper time to clean catch basins by removing from them the accretions of decomposing matter always found at this time of the year. You get the advantage of the spring rains for a thorough flushing, leaving the catch basin in good condition for the advent of hot weather. We also suggest, where practicable, the necessity of providing, for ventilation of the catch basin, a 4 x 4 wooden flue. Carried up from the basin eight or more feet, it could be attached to the cover of basin; or a metal pipe, carried up on the wall of the building above the roof, would be of advantage as a measure of health."

DRAUGHTS OR SLOW POISON.

After all that has been said and done about the so-called "ventilation" of our public rooms, the people who frequent them are still shut in, in nine and a half cases out of ten, to a choice between taking poison and getting a chill—with the facilities much greater for the former. The average assembly room is still typified by the "hot air receiver" in which Adirondack Murray was once lecturing. It was built in the regulation fashion, with close walls on two sides, pierced in four places with small openings into dead-air flues, called, by a fiction of the architect, "ventilators," but up or down which no current was ever known to pass. The ceiling was, of course, solid, and the only chance to let in fresh air to the thousand people who were trying to keep up their heart and brain action on an atmosphere composed of lung exhalations, burnt-up air, and unconsumed gas, was to let down the large windows in the end. Up and down went the rattling sash and rustling curtains, as the gaspers and the freezers took turns at the windows. Finally, the lecturer stopped and said, with the coolness and humor that characterized him: "Friends, you may fix the windows anyway to suit yourselves; only, if I am to finish my lecture, I should like to have them stay fixed, one way or the other. For myself, if I am to have a choice between freezing to death or suffocating, I should prefer the former method as being the cleaner. But, if the world stands for another year, and this dreadful hall with it, and you are to have another course of lectures, I would advise you to punch a hole through that roof," indicating the highly frescoed ceiling with his superb gesture.

The process hinted at in this rough suggestion has been followed in many of our pretentious halls and theatres. The builders have "punched a hole through the roof," in a more or less ingenious and artistic fashion; but, in thus providing an escape for the bad air, they have exposed a large percentage of the occupants of the room to direct or cross currents of air every time a lobby door is opened or a window is raised. There is yet no science of ventilation; or, if there be, it has not been applied where it is most needed. Many fairly effective devices for taking the overheated air out of a room have been invented; but the rooms are rare into which any adequate supply of pure air is introduced. The furnace fiend in the cellar will belch his blighting breath into a room as fast as it can find a way out—and too often faster, as the baked brains and laboring lungs can testify. But a rational system of ventilation, based upon the law of demand and supply, and avoiding stagnation on one hand and draughts upon the other, has not yet been brought within the reach of the general public. People susceptible to the insidious effects of foul air, and who visit places of public amusement, know what a "theatre headache" is. They have a reminiscense of the taste of the atmosphere in their mouth the next morning, though they may not know what it is. Of all places in the world, except sleeping or thinking rooms, where pure air is needed a public dining room is the oftenest neglected in this particular. Added to the heat of the furnace or the steampipes, is the smoke of the gas and the scent of the dishes, and sometimes the fumes of the kitchen. In onr grand hotels, elegant and perfect in all their other appointments, there is often—we may say commonly—no way of reducing the temperature and freshening the air except by lowering a window—with what effect Mr. Fitz feelingly hinted in the humorous speech to which we alluded in the opening. It destroys half the enjoyment of a good dinner to introduce pure air in this fashion, merely as an *entrée* in the elaborate *menu*. One does not want to carry away incipient pneumonia or an aggravated catarrh as the penalty for dining away from home.—*Boston Herald.*

REGULATION OF PLUMBING IN TORONTO.

Much of the plumbing done in Toronto is very poorly done. When new houses are erected, the result of bad plumbing is very unsatisfactory to the occupants, and in many cases leads to sickness and death. From a sanitary point of view, it would be well for the plumbing done in Toronto to be controlled by legislative enactment. Plumbers should be required to submit themselves to an examination, and s' ow that they are capable of carrying out their contracts in a proper manner. The best way to do would be for all plumbers to lay the plans of the plumbing to be done in new buildings before the City Commissioner—before whom the plans of all buildings should be laid—so that the sanitary necessities of the city could be supplied, and the health of the people protected from fevers caused by bad drainage and imperfect plumbing.—*Toronto Telegram.*

The *Telegram* is quite right. Plumbing should be under the control of municipal authority. The enforcement of the plumbing regulations in this city has been of inestimable value. If Toronto will send a delegation to this city to investigate the methods employed by our city Health Department, and adopt similar regulations for the control of her plumbing, there will not remain such just cause for complaint.

Governor Cleveland, of New York, has signed the tenement house cigar bill, prohibiting the manufacture of cigars in apartments or rooms used as dwellings, except the first floors of tenements in which are stores where cigars are kept for sale. The bill becomes a law Oct. 1.

The New York County Medical Society have taken steps to establish a hospital for scarlet fever, diphtheria and measles in this city.

WARMING A CHURCH.

CHICAGO, *March* 5, 1883.

To the Editor of THE SANITARY ENGINEER:

The plan of church warming described on page 294 of last number is not new nor uncommon in this vicinity. One church here has used that system for 23 years. I have also seen it used in connection with small holes in the floor

under the pipes connected with fresh air from outside. A better plan, I think, is to run a single pipe on the floor to front end of church either in basement or on one side of partition between seats (see sketch), thence back on the other side with branches of one inch pipe for each seat made like a Nason tube. This partly overcomes the ob-

jection of having too much heat in the pews. I have another plan for warming and ventilating churches (where the basement is not used for class rooms, etc.) that is

superior to anything I have seen. When I can spare the time I will send you a description and sketch.

Yours truly, L. HAMLIN.

[We think there is a little danger of having noise with

this plan unless the heating pipe both ways from the Tee pitched slightly upward as shown by the dotted line—a detail of course.

We will be glad to see your *better plan.*]

ELECTRIC LIGHT NOTES.

City Councils of Philadelphia the 15th inst amended the ordinance to permit the Baltimore and Ohio Telegraph Company to place wires through the city so that the company is required to lay the wires underground in the built up portions. The mayor has made it known that he will veto any ordinance granting the right to erect poles in the streets.

The New York *Times* fears that a job is behind a scheme which was rushed through the Board of Aldermen with great haste last week giving the New York Electric Lines Company permission to open the streets for laying wires underground. A clause in the ordinance requires the company to pay to the city 2 per cent. of its gross receipts, and another forbids the company to transfer its franchise without consent of the Common Council. The incorporators are Sidney F. Shelbourne, William Force Scott, Geo. L. Weed, Herbert P. Brush, and Edward Barr.

Capt. F. U. Greene, U. S. Engineers, after inspection of systems of underground electric wires in Boston and New York, is in favor of prohibiting the further erection of poles in Washington. He recommends that experiments be made with the fire alarm wires to test an underground system less expensive than those now usually employed, and he recommends that estimates be submitted to the next session of Congress for placing all fire alarm wires undergronnd, and a bill be prepared compelling all electric wires to be put undergronnd at an early date.

The *Mechanic* states, on authority of Postmaster General Fawcet, that within a radius of four miles of the general post office in London there are 4,388 miles of wire underground, besides 600 miles of private wires.

According to the London *Telegraph*, M. Marcel Duprez has transmitted power to long distances with success by aid of electricity. Upward of three-horse power was first transmitted a distance of twenty kilometres, and then thirty-five kilometres, by means of an ordinary wire four millimetres in diameter. The proportion between the forces expended and received was 50 per cent.

A meeting of the trustees of Columbia College was held the 13th inst. to consider the establishment of a school of electrical engineering. Mayor Low, of Brooklyn was delegated to confer with the electric light, telegraph and telephone companies on the matter. President Barnard, says the *Times*, states that representatives from some of the companies had expressed themselves in favor of the school, and the committee therefore decided that if these companies would give the plant to begin with, and guarantee the sum of $12,000 per annum, Columbia would organize the school, furnishing its own professors, as far as possible, and appointing a Professor of applied electricity or electric engineering with such attendants as were necessary.

A company has been formed in Newark, N. J., under the title "The American Electric Storage Company," to push the inventions (patents on storage batteries) of Nathaniel S. Keith, of this city.

Mr. F. W. Whiting, in the employ of the Boston Manufacturers' Mutual Insurance Company, recommends as a means of obviating the trouble caused in cotton and woolen mills by generating electricity by the friction of the belts and pulleys, that a wire be attached to a carding machine and carried to a gas or water pipe.

Meter-ites.

A New Jersey company have a furnace which, they claim, burns without smoke. The draft is produced mechanically by a fan. When coal is put on the fire the door under the grate bars is closed, allowing no air to enter, and the coal is baked as in a gas retort, the volatile gases distilling over into a second chamber with an arrangement like an argand burner. Air is drawn in through at opening in the bottom of the second chamber and circulates around the walls of the chamber, and is then drawn in through a circle of holes meeting the gases evolved in the first chamber, producing complete combustion.

The *Journal of The Society of Arts* describes the coal fields of New Zealand. The principle deposits are near the Molyneux river in Otago, in the South Island, extending 50 miles. This district is estimated to contain 100,000,000 tons of accessible coal; near Dunedin is another capable of yielding the same quantity. Another great coal area is on the western seaboard of Otago. The total yield in 1880 of all the New Zealand mines was 299,923 tons.

The *Water Gas Journal* says: "Owing to the large amount of pure oxygen and hydrogen contained in the Lowe water gas, it can be burned in much larger volumes, without smoke, than is the case with coal gas." It is a misfortune for any illuminating gas to contain "pure oxygen," and we doubt if the advocates of the Lowe process would endorse the statement. When light is wanted the oxygen for the combustion of the gas should come from the outside, and should not be mixed with the gas before combustion.

Food and Drugs.

NEW YORK ADULTERATION LAW.

The meeting of the State Board of Health, which we reported in our last, developed several features worthy of more than passing comment. It was quite a representative meeting, and might be considered in many ways unique. We saw adulteration fully represented, and for once it came out in its true colors. The peculiar feature which must strike all was the apparent interest some of these manufacturers of adulterated food would have us believe they take in the welfare of this State. If the law is to be administered as the Board have decided, the capital which is now employed in manufacturing those fabrications would be transferred from this State to another. Can it be possible that these New York adulterators imagine they will obtain by means of threats concessions contrary to the spirit of the adulteration act from the Board of Health? If so, we believe they will be much mistaken. The duty of the Board is to carry out the letter and spirit of the act. As representatives of the people, they must do it with an unfaltering hand. To do this they must protect the consumer, and in doing so they at the same time protect the honest trader. As we have said again and again, sooner than the law should bend to suit the convenience of these manipulators, let them go and seek fresh fields and pastures new.

When the administration of this act gets into working order and is carried out in a proper spirit, the result must be highly beneficial to the health of the people and to honest traders. It will no longer pay to manufacture cream of tartar containing 92 per cent. of gypsum. Manufacturers will have to make a pure article, or, as we have said before, seek fresh fields and pastures new. The law will deal with these manufacturers in such a manner as to render it profitless. Let all persons interested in the health of the people and honest trading render every assistance to the Board to carry out the act in its entirety until it may be said of these adulterators—

"Othello's occupation's gone."

—*American Grocer.*

A NEW METHOD OF WATER INVESTIGATION.

Dr. R. Angus Smith, whose investigations into impurities of water and air in connection with his work under the Alkali Acts have been of great interest and value, calls attention to a new method of testing drinking water, which he thinks promises to be of great practical importance, more so, in fact, than the chemical methods heretofore employed, although these last cannot be neglected.

This method consists in the use of gelatine very much as it is employed by Dr. Koch in his culture experiments.

Gelatine, dissolved in a little water, is mixed with the water to be tested to such an extent that the gelatine solid amounts to 2½ per cent. of the mixture. This forms a transparent mass in which the results of the development of any organisms in the water can be readily observed. Each active point manifests its presence for the formation of a little sphere in the gelatine, so that for a time, at least, the results are preserved and can be easily recorded.

The water must not have too much gelatine in it, if so the action is stopped. It must not have too little, if so the gelatine becomes liquid too soon and the action of the individual centres is not observed.

Digitized by Google

When a centre acts it makes around it a sphere in some waters, and the sphere, which has the appearance of a thin vesicle, is filled with liquid. These spheres form in a day or two, according to the water, and at the bottom is a white mass, containing active bacteria chiefly. The liquid filling the spheres may be taken out by a pipette and examined, as also the bacteria which lie at the bottom. The striking amount of spheres and gas bubbles in some cases render the examination of water by this method less dependent on the spirit of the operator, and a photograph may be taken of each specimen and the result preserved as evidence.

In certain specimens of Manchester supply the spheres appear on some days very few, on other days the amount is enormous and heavy, the whole of the tube in which the experiment is made being filled with spheres. At such times the water is highly impure and complained of by the public.

Of course, so far as this test is a quantitative, *i. e.*, as to the number of spheres developing in a given time, it is one for the number of organisms present. Some of them will be present in all ordinary water, and, therefore, the occurrence of the spheres is no proof that the water is unwholesome, although as a rule the fewer there are the better is the water. Nevertheless, entire absence of these spheres may be due to superabundance of organisms or to want of air. In one case Prof. Smith found a water which gave no bacteria except on the surface, but when air was compressed over it to the extent of above three atmospheres, the spheres became abundant.

In sewer water the spheres do not appear, but the whole mass becomes turbid and the gelatine soon liquefies.

The most important thing about the new method is the power which it gives us to determine with precision the effects of different kinds of organisms, when supplied with different kinds of nutriment and kept at different temperatures, etc., and there is reason to hope that in this way we may be able to distinguish the disease producing organisms from others, and to say whether a given specimen of water, for example, does or does not contain the specific cause of typhoid fever.

Prof. Koch is working at this subject, and we hope that it will be thoroughly tested by some of our own observers.

SMALL-POX IN NEW ORLEANS.

The New Orleans *Times Democrat*, of March 2, contains an interesting account of the proceedings of a meeting called by the Executive Committee of the New Orleans Auxiliary Sanitary Association for the purpose of conferring with the ministers of the various colored congregations in the city with reference to means to be adopted for checking the spread of small-pox.

By a report presented by Dr. Watkins it was shown that since the beginning of 1883 there have occurred in New Orleans 187 deaths from small-pox. About one-fourth of the population of the city is colored, and the number of the deaths from small-pox was 122. In other words, the mortality from this disease is nearly eight times as great among the colored population as it is among the whites. The chief cause for this is stated by Dr. Chaillé to be the want of vaccination among the colored people, the estimate being that about 15,000 of this class are at present unprotected by vaccination.

The representatives of the colored population present at the conference unanimously expressed their willingness to do everything possible to aid the Association to carry out its plans for securing vaccination among the poor and ignorant, and it was decided that the colored ministers should urge the matter upon their several congregations, upon the following Sunday.

This is true, practical missionary work.

By way of contrast the same paper contains an account of the action of the Louisiana Board of Health, the result of which was the passage of the following resolutions:

"WHEREAS, a petition of citizens has been presented to this Board, having for its principal object a repeal of the resolutions in relation to the New Orleans Auxiliary Sanitary Association, adopted unanimously by this Board at its session Dec. 14, 1882, and

"WHEREAS, grave reasons then existed, and still exist, for the passage of the aforesaid resolutions, having their origin in the legislation and operation of the New Orleans Auxiliary Sanitary Association; and

"WHEREAS, the State Board of Health of Louisiana has no desire to retain said resolutions upon their records when the causes which gave birth to them are removed; be it therefore

"*Resolved*, That the State Board of Health of Louisiana will agree to rescind said resolution when the New Orleans Auxiliary Sanitary Association shall have adopted the following:

"1. The repeal of the resolutions adopted by it, indorsing the National Board of Health, and urging its perpetuation.

"2. The adoption of a resolution indorsing and sustaining Louisiana's legal health representative and guardian, the State Board of Health, to which they profess to be auxiliary."

Knowing nothing of the local politics of New Orleans we do not understand the precise influences by which such a board of health retains its position, but among them may certainly be counted almost unlimited bluster and cheek.

We suppose the time will come when the respectable citizens of New Orleans will have this board in some way suppressed. At present its existence is a constant menace to the commercial and sanitary interests of the city.

THE ANNUAL REPORT OF THE BOARD OF HEALTH OF THE CITY OF NEWARK, N. J., for the year ending Dec. 31, 1882, is a pamphlet of 16 pages, prepared and signed by Dr. F. B. Mandeville, the Health Physician of the City.

It states that "the Board have administered the sanitary laws and regulations with moderation, prudence and efficiency" which we do not in the least doubt, but we must confess that we should like to have seen some evidence of it presented in the report. We are told that most careful attention has been given to the milk supply, that a milk inspector was appointed, and that when he began he could hardly find any milk that was up to the standard, but that now he can hardly find any below it. Now, we should very much like to have the details of this inspector's work, and so would the citizens of Newark. How much milk has he inspected in each month? how much has he condemned? why did he condemn it? and what was done with the milk thus condemned?

Allusion is made to "the intolerable sewerage nuisance that exists in the tenth and fourteenth wards," but no particulars are given and no particular action recommended.

We are told that the city has 15,000 privies and half as many cesspools, that the city provides no dumping grounds, but the only recommendation made is that "the city should provide proper dumping grounds to be used under the direction of the Board; no scavenger should receive a license unless he agrees to use the same, and their entire direction should be left to the management of the Board of Health."

It seems to us probable that it will be necessary to do a good deal more than this before Newark will have put herself in proper sanitary condition, so far as regards the disposal of her excreta.

We are told that there were during the year 3,921 deaths, but no attempt is made to calculate the annual death rate, or to present the statistics in any such a way as to be interesting or instructive.

No information whatever is given as to the expenditures of the Board, or the amount which the city pays for sanitary work. The report closes with the suggestion that more power should be given to the Board, but we are not told what kind of power is desired.

If Dr. Mandeville would now prepare a supplementary report which should contain full information upon the various points above suggested, we feel sure that it would be an interesting document, not only to the citizens of Newark, but to sanitarians everywhere.

BOOKS RECEIVED.

FIRST ANNUAL REPORT OF THE BOARD OF HEALTH OF KANSAS CITY, for the calendar year, 1882.

IN MEMORY OF WILLIAM BARTON ROGERS, LL.D., late President of the Society of Arts of the Massachusetts Institute of Technology.

DIPHTHERIA AND SCHOOLS.

Under the date of Jan. 23, 1883, is printed a report made by Dr. Hubert Airy to the Local Government Board of England, upon an outbreak of diphtheria at Coggeshall, Essex, which occurred in the latter part of the year 1882. With two or three exceptions only, all of the infected families belonged to those which sent children to the church schools, no cases occurring in connection with the private schools. As soon as this fact became evident, the Health Officer, Dr. Abbott, urged that the schools should be closed, and they were closed on November 3. The number of new families attacked fell in the following week to three, and these were all attacked within four days after the church schools were closed, and were all families sending children to those schools.

"The church schools, having been closed 17 days, were re-opened on November 20 by the school managers, without consulting the sanitary authority. Since then there have been several fresh cases, two of them fatal; and the infection has spread to families of children attending the chapel school. On the representation of the Medical Officer of Health, the sanitary authority have (December 12) obtained the temporary closure of both church and chapel schools.

"At an early period in the epidemic, when it appeared that the spread of the disease was in some way dependent upon attendance at the church schools, suspicion fell upon the water of a pump in the boys' play-yard, to which all the children had access in one way or another. We have the means of testing, to some extent, the theory of the diphtheria being caused by the water, in the circumstance that one section of the school children, who stayed at the school for the dinner hour, had more opportunity than the rest of drinking the pump-water. If this water were the vehicle of the diphtheria contagium, we should expect to find a greater incidence of the disease among these children. But, in fact, the incidence of diphtheria was, if anything, rather less among these children than among those who went home to dinner. In the former group, comprising about 70 boys and girls, there were four or five cases of diphtheria—six or seven per cent. In the latter group, containing 353, there were about 30 cases, or eight per cent. The inference to be drawn from these data is that greater consumption of the pump-water did not cause greater incidence of diphtheria; and probably, therefore, this water was not concerned in causing or spreading the disease.

"There was no indication that the diphtheria was spread by milk, nor was there any reason to think that it was caused by air escaping from defective drains. At the schools there was no perceptible drain-nuisance, and the homes of the children attacked were scattered about the village and neighborhood, and were for the most part quite independent of one another as regards drainage."

The Royal College of Physicians of London is considering the propriety of instituting examinations and granting special certificates or diplomas in the subject of Hygiene.

The *Lancet* commends the proposal saying, "If the question referred to a special examination being instituted in midwifery, opthalmology, gynæcology, dermatology, or the like, we should unhesitatingly declare against it, since these are based on the study of anatomy, physiology, and pathology, in the same way as is general clinical medicine. But with hygiene special scientific subjects have to be studied. A medical officer of health should have a thorough knowledge of geology, of physics, mechanics, hydrostatics, and pneumatics. He must be a good analytical chemist, and it is absolutely requisite that he possess a practical knowledge of architecture—at all events, of all essential points connected with the building of dwelling-houses; and he should be skilled in all matters concerning bricklayers' and plumbers' work, in order to direct operations or to expose scamping. Now, however important it is for every medical man to give advice and to have a tolerably distinct idea with regard to questions of sanitary science, it is only a few who desire to make the study of it a special pursuit, who will have mastered all these technical details, and it is only fair that the man who has the special knowledge should have the opportunity of showing he possesses it. If only a general average is required with regard to hygiene from all candidates possessing a medical degree without reference being made to any special qualification, how are local boards to distinguish between candidates possessing the technical knowledge required from a medical officer of health and candidates who do not possess it."

The move is a good one and indicates the drift of public opinion. The public needs competent trained health officers, and it needs some means of knowing who they are. The action of the College if favorable to the proposition will be of decided benefit to the course of sanitation.

Construction Notes.

PRINCETON, N. J.—Proposals for New Jersey Water Works, Feb. 27, 1883. Well 25 feet diameter, 18 feet through saturated gravel. Brick work to be 24 feet high and floored over partly with iron beams and brick arches, and partly wtih pine flooring.

Brick engine house, circular, on well, single story, conical roof, frame boiler house, chimney 40 feet high, stone foundation for tower 100 feet, on hill 6,000 feet from well.

Condon & Rehill	$5,700.00
J. T. Rowland	6,184.00
E. H. Fairchild	7,355.00
D. H. Valentine	8,388.00
J. J. Newman	9,400.00

Awarded to Condon & Rehill, Jersey City.

Pipe laying, 9,560 feet ten-inch; 2,850 feet six-inch; 5,620 feet four-inch; ten fire hydrants, setting stop cocks, etc.

Adams & Foster	$6,649.00
J. J. Newman	6,921.60
J. J. Cogan	7,374.45
Henry Lewis	7,464 40
D. H. Valentine	7,535.80
Everson & Crane	7,559.10
E. H. Fairchild	8,207.35
S. Trumbore	8,740.10
J. T. Rowland	9,107.80
Condon & Rehill	11,045.90

Awarded to Adams & Foster, Pottsville, Pa.

CHICAGO.—At the West Side Pumping Station preparations are being made to put in two new engines, each with a capacity of 15,000,000 gallons, which will increase the capacity of the works from 30,000,000 gallons to 60,000,000 daily, and the capacity of all the pumps of the city to about 130,000,000 gallons. Mr. Creigler has gone to New York to make the purchase of these new engines, and he will have them in place and working by next fall.

BROOKLYN.—Proposals for the construction of new school houses were opened at the meeting of the Board of Education on the 13th inst. Contracts will be awarded as follows, to the lowest bidders:

Colored School No. 1. For carpenter's work: Francis G. Turner, $8,235. For mason work, John D. Anderson, $11,473. For plumbing work, E. A. Miller & Co., $750.

Public School No. 21. For carpenter's work, Martin & Lee, $11.559 For mason work, James Ashfield & Son, $15,697. For plumbing work, E. A. Miller & Co., $947.43.

Public School No. 26. For carpenter's work, Martin & Lee, $11,634. For mason work, James Ashfield & Son, $16,597. For plumbing work, E. A. Miller & Co., $977 43.

Public School No. 40. For carpenter's work, Martin & Lee, $12,472. For mason work, F. J. Kelly, $18,197. For plumbing work, Brian & Jennings, $1,105.

Wings of Public School No. 30. For carpenter's work, (including plumbing), Francis D. Morris, $6,875. For mason work, P. Carlan & Son, $6,100.

GOVERNMENT BUILDINGS.

Court house and post office, Topeka, Kansas. Synopsis of bids for iron stairs received under advertisement of Feb. 23, 1883 and opened Mar. 14, 1883.

Hugh Ketcham & Co.	$7,898 75
McHose & Son	10,750 00
Snead & Co.'s Iron Works	6,200 00

The contract for erecting the marine hospital buildings at Memphis, Tenn., has been awarded to John Reid, of that city, for $38,775.

PHILADELPHIA GAS TRUST CONTRACTS.

The following bids have been received for gas pipe, the specification calling for 1,280 lengths of 30-inch and 750 lengths of 16-inch cast iron pipes and connections, the lengths to be 12 feet:

Union Hydraulic Company, Philadelphia—Connections 2⅞ cents per lb.

Burlington Stone and Heater Co., Burlington, N. J.—Per foot, 30-inch, $5.25; 16-inch, $1.89; connections, 2 6-10 cents per lb.

R. D. Wood & Co., Philadelphia—Per foot, 30-inch, $5.26; 16-inch, $1.83; connections, 3 cents per lb.

Warren Foundry and Machinery Co., New York—Per foot, 30-inch, $5.62; 16-inch, $2; connections, 3⅛ cents per lb.

A. H. McNeal, Burlington, N. J.—Per foot, 30-inch, $5.24; 16-inch, $1.90; connections, 3⅛ cents per lb.

Mellert Foundry and Machine Co., Reading, Pa.—Per foot, 30-inch, $5.37; 16-inch, $1.83; connections, 3 cents per lb.

Gloucester Iron Works, Gloucester, N. J—Per foot, 30-inch, $4.97; 16-inch, $1.77; connections, 2½ cents per lb.

The contract for the several classes has been awarded to the Gloucester Iron Works.

WHITE PLAINS, N. J.—The people are considering the building of water works and introduction of sewerage.

BROOKLYN.—Proposals will shortly be invited for laying the water main through the Eartern District from the Ridgewood reservoir to First streeet. The cost of the new line will exceed $250,000.

NEW YORK CITY.—The lowest bid for about 2,000 feet of lattice rail to be placed along the sides of the promenade and roadways of the East River bridge was made by Manley & Cooper, at 49 cents per lineal foot.

EXTENSION OF BROOKLYN WATER WORKS.

Surveys have just been completed for a proposed extension of the Brooklyn Water Works from Rockville Centre, its present terminus, to South Ogden Bay, a distance of about ten miles. The line takes in several streams and ponds and is expected to increase the daily supply by at least 20,000,000 gallons. The estimated cost is $2,500,000. The preparation of plans is intended to be completed in time to petition the next legislature for the necessary authority.

Inspector Terry, of Boston, seized 23 carcasses of "bob veal" at the Boston & Maine Railroad station the other day.

A citizen of Wilmington, Del., is greatly disturbed in his mind about the City Council's having called on Mr. Hering for a report on the best plan of sewering the city. His two principal causes of complaint are that Mr. Hering lives in New York and does not approve of leaching cesspools. The non-resident argument against any man or system, is a very powerful one to certain minds. General Sisera used it a good many centuries ago against the River Jordan. The advantages of cesspools in porous soil, sunk to the level of the ground water, are obvious to those to whom filth out of sight is also out of mind, whether at Wilmington or Trenton. But, fortunately, the world moves, though some of its occupants stand still.

The Hartford, Conn., Water Commissioners Report for March 1, 1883, shows an increase of receipts and decrease of expenditures as compared with the previous year. The receipts were $84,418.88 in excess of all expenses of maintenance, repairs and extensions of the works. They were thus enabled to pay the interest on the water debt, to pay off $25,000 of the principal, and have a surplus of $1,958.38. The receipts from water rents of 1882 amounted to $132,255.44 from 5,168 consumers. The cost of operation and maintenance of the works was $20,020.10, or about $3.90 per consumer, for which the city collected $25.60 from each consumer. The interest on the water bonds amounted to $57,460.50, or $11.12 per consumer. Every piece of property on which city water is used in Hartford, paid, therefore, $15.02 for expenses of maintenance and interest, and $10.58 additional for the benefits to the property on which no water was used. It is worth considering whether it would not be fairer to all parters to make all improved property pay its proper proportion of the expenses of the works.

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

The aldermen of Yonkers wisely decided not to submit the engineering questions involved in the purification of the Nepperhan to popular vote. They have instead concluded to give the advocates of various methods of remedying the evil a public hearing, at which all amateur experts can speak their mind. In this connection it is not amiss to quote a saying of Henri Rochefort: "Anyone can be an expert if he can find someone else inexpert enough to take him at his word."

Dr. Harvey Jewett, of Canandaigua, in his recent address as President of the Medical Society of the State of New York, made some well-timed and sensible remarks upon the duties of medical men in relation to sanitary matters. After pointing out that much more is now demanded of the practicing physician than was the case twenty-five years ago, special attention was called to the inability of the majority of practicing physicians to properly advise their patients and patrons in sanitary matters, owing to their ignorance of the first principles of sanitary science.

The finger of investigation points to certain defects in drainage, water supply, or ventilation, as the prolific source of disease. How many physicians are able to recognize these defects with certainty, or to give competent advice for their remedy? How many health officers, especially in the smaller settlements, are versed in the principles of natural philosophy which lie at the foundation of all drainage and ventilation? Surely, the work of inquiry into the etiology of disease demands that the investigator be equipped with more than a surface knowledge of chemistry, and be more than a novice in the use of the microscope. "I claim," he says, "that the physician, who is not only to minister to the sick, but in his noble work, to protect the health and lives of others, should possess as a foundation for the superstructure of his strictly medical education, an accurate and serviceable knowledge of the principles of chemistry, natural philosophy and the natural sciences generally."

"That many physicians graduate with this needed preparation, and thoroughly equipped in all respects, is a matter for congratulation. But those do not compose the rank and file of the profession in this country to-day. The demand is for more thoroughly educated medical men and women, and that demand must be met by men taken, not directly from the farm, the work shop, and the common school, but by those favored with the rigid mental discipline of academy or college, and well grounded in the principles of natural science. * * *

"So pressing does the need appear of more thoroughly educated and studious men to stand as guardians of the public safety in every village and hamlet of this vast country, that I cannot, in conclusion, but revert somewhat to the thought which found utterance at the opening of these remarks. We want men in every country district of the land, as well as in every city, who shall be worthy the name of professional gentlemen. Who, in general information and culture, though mingling largely or solely with the uneducated, shall be among them and not of them, and who, by reason of the power which knowledge and mental discipline gives, shall be leaders among the people in every good enterprise, and give a dignity to and a respect for the profession of medicine which, I regret, it does not fully possess to-day. Under the present system of medical education, I fail to see a prospect for the achievment of this desirable result. So long as men are permitted to graduate from some of our most reputable medical schools, to enter the ranks of the regular profession so poorly equipped for life service in a profession which demands the very best of talents and preparation, we cannot wonder that quackery continues to flourish and to receive the patronage, humiliating to confess, of some who are on other subjects the most enlightened.

"When the requirements for entrance upon the study of medicine in our medical schools are made vastly higher, when the teaching is better systematized and a longer time in preparation is insisted upon, not only will the profession rise higher in public estimation, but there will then be opportunity for the teaching of hygiene and some other departments, for example that of legal medicine, which now are, as a rule, sadly neglected.

"Thanks to earnest workers and great facilities for education, both at home and abroad, the profession of medicine in America, shows a very bright side, as well as a dark one, to which I have alluded. Scattered through the entire country are men at work who are shedding lustre upon their profession, and others to be numbered by the hundred, who in a quiet way are doing all that is possible to magnify their calling and to induce the respect of mankind.

"When such men take the places universally of those who, it is to be regretted, by no means adorn their profession, we shall hear fewer denunciations of doctors, which we know sometimes to be too well deserved, but which reflect none the less surely upon the profession as a whole, because incurred by some unworthy member who is yet in the ranks by the tolerance both of his professional brethren and the law of the State.

"No monomaniac will then be permitted, in the public prints, to flaunt his maledictions upon 'physic and physicians' as 'twin scourges of humanity,' because of the respect which the medical profession will everywhere command. Though less in numbers, because of the necessities of the case, when preventive medicine shall have attained its destined eminence, we shall hold a prouder position, and be more than ever the benefactors of the race."

The Asbury Park *Shore Press* becomes very indignant over a recent publication reflecting on the sewerage of that place, and states that the sewers were begun in 1879, have been gradually extended each year since and have worked satisfactorily. There are 12 miles of sewers in use.

"Only one portion of the whole system of sewerage has at any time caused annoyance to the public. During the summer of 1882 the original experimental wooden receiving vault, located on the sea shore, became leaky, and permitted its contents to flow out upon the sand. This caused rapid liberation of gases, and, until it could be repaired, it created an abominable nuisance in the neighborhood of the said vault. Another vault, constructed of brick and cement, which was built after the efficiency of the sewer system had been established, has given no trouble."

It is further stated that 3,400 feet of sewers are laid on a grade of ½ inch in 100 feet. This is a hardly appreciable fall, and is likely to cause trouble unless provision is made for frequent and copious flushing.

Patents.

[*It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, and Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.*]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

266,816. HEATER FOR DWELLING-HOUSES. James B. Harris, Jr., Geneseo, N. Y. Filed April 28, 1882. (No model.) Issued Oct. 31, 1882.

Claim.—1. In a water-ring, B[111], the vertical partition c^1, provided with opening d^1, substantially as herein shown and described, for the purpose of aiding in the circulation of the water within the heater.

2. The water-base E, provided with vertical diphragms h^1 h^1, in combination with the pipes C g^1 l^1 L, substantially as and for the purpose described.

3. In a heater, the combination, with the fire-pot B[11], the pipes g^1 l^1 G, and the water-space E[1], of the drum H and the inclined circular pipes I, substantially as and for the purpose set forth.

4. In a heater, the combination, with the fire-pot B[11], the water-ring B[111], the pipes g^1 l^1 G, and the water-space E[1], of the drum H, the inclined circular pipes I, and the pipes K m^1, substantially as and for the purpose set forth.

5. In a heater, the combination, with the water-space E[1], surrounding the base E, and the drum H, of the curved pipe L, extending from the water-space E[1] radially through the heater, and thence curved inwardly into the drum H, substantially as and for the purpose set forth.

267,103. FAUCET. Edwin F. Pierce, Milwaukee, Wis. Filed Dec. 27, 1881. Renewed Sept. 23, 1882. (No model.) Issued Nov. 7, 1882.

Claim.—1. In a single faucet, the combination and arrangement of two stoppers upon a single connecting-rod, one of said stoppers being located below the spout and adapted to close with the water, and the other located above the spout and adapted to be closed against the water and serve as a packing to prevent the escape of water around the faucet-stem when said lower stopper is opened, substantially as set forth.

2. In faucets, the device for communicating downward pressure to said valves, consisting in the combination of stem G, axle E, provided with anti-friction rollers F F, and stationary disk I, provided with cams D D, said stem G being formed in a separate piece from and adapted to bear upon said rod as it is revolved, substantially as set forth.

3. In faucets, the combination, within the barrel or body thereof, of stopper A, located above the spout, stopper B, located below the spout, connecting-rod C, stem G, handle H, disk I, cams D D, rollers F F, and axle E, all substantially as set forth.

267,174. ROTARY WATER-METER. Benaiah Fitts and James F. Wilson, Worcester, Mass. Filed June 5, 1882. (No model.) Issued Nov. 7, 1882.

Claim.—1. In a meter mechanism, a partition or bulk-head piece introduced between the eccentrically-arranged piston and the surrounding cylinder or ring-gear, for separating the intermediate space into receiving and delivering chambers, substantially as set forth.

2. The combination, in a meter, of an outer ring or cylinder having internally-arranged projections or cogs, an externally-toothed intermeshing piston mounted upon an axial support or journals eccentric to and revoluble about the main or central axis, and an intermediate barrier or partition adapted to move about the main axis in unison with the axial bearing of said piston, substantially as hereinbefore set forth.

3. The combination, with the ring-gear and intermeshing piston-gear, of revoluble end plates concentrically journaled within the cylinder-heads, and adapted for supporting the partition or bulk-head piece and the piston-journal, substantially as set forth.

4. The partition or barrier-piece F, constructed with one or more conduits or passages, in combination with the cylinder-gear and revoluble piston, whereby said partition is adapted to serve as a mouth-piece for the entrance or exit of fluid to or from (either or both) the piston-chamber of the meter, substantially as hereinbefore set forth.

5. The combination, with the cylinder-gear, revoluble piston, and revoluble end plates having conduits or openings to the piston-chambers, of the heads A[1] A[2], provided with connecting-bosses *a* a^1, and having annular chambers W, whereby fluid can be taken and discharged irrespective of the varied positions of the internal revoluble parts, substantially as set forth.

6. The combination, with the intermeshing cylinder-gear and piston-gear, of heads or end plates having the recesses or channels *m*, as and for the purpose set forth.

267,190. WATER CLOSET. Stephen Goldner, Baden, Germany. Filed Aug. 24, 1882. (No model.) Patented in Germany June 26, 1881, in France July 16, 1881, in Belgium Oct. 14, 1881, in Great Britain Oct. 20, 1881, in Spain Nov. 9, 1881, in Italy Nov. 12, 1881, and in Austria-Hungary Jan. 15, 1882. Issued Nov. 7, 1882. Issued Nov. 7, 1882.

Claim.—1. The combination, with the receiver or reservoir provided with overflow and discharge pipes, the latter connected with said receiver at the bottom, of the soil pipe dipping into said receiver or reservoir a suitable distance, as indicated, below the mouth of said overflow pipe, substantially as described.

2. The combination of the receiver adapted to contain a volume of water, the soil pipe projecting below the level of the water therein to about the depth indicated, the overflow pipe at the top of said receiver, and the discharge pipe at the bottom thereof, normally closed by a valve or stopper, substantially as described.

3. The combination of the receiver, the soil pipe projecting therein-into, the discharge normally closed by a valve or stopper, and the overflow connected with the receiver at a point above the lower orifice of said soil pipe and emptying into the discharge pipe beyond said valve or stopper, substantially as described.

267,264. FUNNEL TRAP FOR SINKS. John G. Schill, Hoboken, N. J. Filed March 2, 1882. (No model.) Issued Nov. 7, 1882.

Claim.—The combination, with the sink B, of the funnel A, projecting from the bottom of the same, the funnel D, provided at its inner surface with recesses, *a*, and the cup G, held within the funnel D and provided with lugs *b*, substantially as herein shown and discribed, and for the purpose set forth.

266,580. ARTIFICIAL BUTTER AND METHOD OF MAKING THE SAME. William H. Burnet, Chicago, Ill. Filed June 30, 1882. (No specimens.) Issued Oct. 24, 1882.

266,613. HOT-AIR GENERATOR FOR FIRE-PLACES. Jesse S. Deardorff, Canal Dover, Ohio. Filed May 5, 1882. (No model.) Issued Oct. 31, 1882.

266,629. FAUCET ATTACHMENT OR CASK-STOPPER. William W. Jackson, Chicago, Ill., assignor of two-thirds to George H. Eaton and Cabel W. Webster, both of same place. Filed Aug. 11, 1882. (No model.) Issued Oct. 31, 1882.

266,631. COMBINED GAS AND OIL BURNER. James H. Kidder, Lawrence, Mass. Filed Aug. 31, 1882. (No model.) Issued Oct. 31, 1882.

266,634. GAS-BURNER. James G. Miller, Green Bay, Wis. Filed Mar. 24, 1882. (No model.) Issued Oct. 31, 1882.

266,639. REGRINDING VALVES. Jeremiah O'Meara, New York, N. Y. Filed June 6, 1882. (No model.) Issued Oct. 31, 1882.

266,676. GAS-BURNER. Sidney Cook and John H. Piper, Boston, Mass. Filed March 18, 1882. (No model.) Issued Oct. 31, 1882.

266,677. CONDUIT FOR ELECTRIC LINES. Robert H. Corbett, New York, N. Y. Filed Dec. 27, 1881. (No model.) Issued Oct. 31, 1882.

266,681. CONDUIT FOR ELECTRICAL CONDUCTORS. Geo. S. Eaton, Brooklyn, N. Y. Filed May 1, 1882. (No model.) Issued Oct. 31, 1882.

266,693. WATER-FILTERING DEVICE. Augustus H. Horsnell and William Murphy, Montreal, Quebec, Canada. Filed Jan. 16, 1882. (No model.) Issued Oct. 31, 1882.

266,793. ELECTRIC DISTRIBUTION SYSTEM. Thomas A. Edison, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Dec. 9, 1881. (No model.) Issued Oct. 31, 1882.

266,856. SAND-PUMP. Samuel McCaughtry, Bradford, Pa. Filed June 22, 1882. (No model.) Issued Oct. 31, 1882.

266,888. GAS BURNER. Elias B. Requa, Jersey City, N. J. Filed Sept. 19, 1882. (No model.) Issued Oct. 31, 1882.

266,889. GAS-BURNER. Elias B. Requa, Jersey City, N. J. Filed Sept. 19, 1882. (No model.) Issued Oct. 31, 1882.

266,890. GAS-BURNER. Elias B. Requa, Jersey City, N. J. Filed Sept. 19, 1882. (No model.) Issued Oct. 31, 1882.

266,894. FLEXIBLF SELF-GAGING FAUCET. William T. Robertson, Montgomery, Ala. Filed Sept. 9, 1882. (No model.) Issued Oct. 31, 1882.

266,916. UNDERGROUND ELECTRICAL CONDUIT. Samuel D. Strohm, Philadelphia, Pa., Filed Feb. 13, 1882. (No model.) Issued Oct. 31, 1882.

266,929. FILTERING PETROLEUM DISTILLATES FOR THE SEPARATION OF PARAFFINE. Henry Warden, Philadelphia, Pa., assignor to the Atlantic Refining Company, same place. Filed Sept. 22. 1882. No model.) Issued Oct. 31, 1882.

266,930. COOLING PETROLEUM DISTILLATES. Henry Warden, Philadelphia, Pa., assignor to the Atlantic Refining Company, same place. Filed Sept. 4, 1882. (No model.) Issued Oct. 31, 1882.

266,933. FIRE-PLACE. Charles A. Wellington, Lexington, and Albert Chase, Boston, Mass. Filed July 17, 1882. (No model.) Issued Oct. 31, 1882.

266,954. NON-ABSORBING AND HEAT-INSULATING MATERIAL. Robert J. Eberts and J. Lawrence Lee, New York, N. Y.; said Ebert assignor to the American Heating and Power-Company, same place. Filed Sept. 25, 1882. No model.) Issued Oct. 31, 1882.

266,969. CHANDELIER FOR ELECTRIC CANDLES. Charles A. Cheever, New York, and Willard L. Candee, Brooklyn, N. Y. Filed May 3, 1882. (No model.) Issued November 7, 1882.

266,971. ARTIFICIAL FUEL. Carol H. Coggeshall, St. Louis, Me. Filed March 8, 1882. (No specimens.) Issued November 7, 1882.

266,978. APPARATUS FOR FEEDING SHAVINGS TO STEAM-BOILER AND OTHER FURNACES. Lewis P. Conklin, Green Point, N. Y. Filed June 16, 1882. (No model.) Issued November 7, 1882.

266,979. RADIATOR. Thomas Davis, St. Paul, Minn. Filed May 29, 1882. (No model.) Issued November 7, 1882.

266,981. APPARATUS FOR BATH PURPOSES. Lowell M. Emery, Louisville, Ky. Filed June 30, 1882. (No model.) Issued November 7, 1882.

266,990. APPARATUS FOR SEPARATING PETROLEUM VAPORS. William C. Hall, Oil City, Pa., assignor of one-half to Benjamin F. Brundred, same place. Filed July 19, 1881. (No model.) Issued Nov. 7, 1882.

267,009. DEVICE FOR HEATING RAILROAD CARS. Wm. Martin, Tidioute, Pa. Filed May 12, 1882. (No model.) Issued Nov. 7, 1882.

267,029. MACHINE FOR WELDING PIPE, &c. Alexander A. Smyth, Sr., Titusville, Pa. Filed June 16, 1882. (No model.) Issued Nov. 7, 1882.

265,036. STEAM-GAGE COCK. Marquis De L. Swank, Jasper T. Thornley and John A. Awalt, Anderson, Ind. Filed July 25, 1881. (No model.) Issued Nov. 7, 1882.

267,044. PROCESS OF AND APPARATUS FOR INSULATING WIRES FOR ELECTRIC USES. Richard S. Waring, Pittsburgh, Pa., and J. Burrows Hyde, New York, N. Y. Filed July 17, 1882. (No model.) Issued Nov. 7, 1882.

267,045. INSULATING MATERIAL FOR ELECTRIC USES. Richard S. Waring, Pittsburg, Pa., and J. Burrows Hyde, New York, N. Y. Filed Aug. 17, 1882. (No specimens.) Issued Nov. 7, 1882.

267,046. INSULATING COMPOUND FOR ELECTRIC WIRES. Richard S. Waring, Pittsburg, Pa. Filed Sept. 5, 1881. (No specimens.) Issued Nov. 7, 1882.

267,102. VENTILATING APPARATUS. Emil H. C. Oehlmann, Berlin, Germany. Filed Mar. 27, 1882. (No model.) Patented in Germany Mar. 26, 1880, No. 12,520. Issued Nov. 7, 1882.

267,113. GAS-LAMP. Charles W. Siemens, Westminster, County of Middlesex, England. Filed May 2, 1882. (No model.) Patented in England Nov. 13, 1880, No. 4,683; in France Jan. 6 1881, No. 140,509; in Germany Jan. 7, 1881, No. 15,467, and in Belgium Jan. 8, 1881, No. 53,520. Issued Nov. 7, 1882.

267,114. APPARATUS FOR COOLING AIR. John P. L. Simon and Charles Abele, New York, N. Y. Filed Mar. 1, 1882. (No model.) Issued Nov. 7, 1882.

267,115. TOWER FOR ELECTRIC LIGHTS, &c. Charles D. F. Smith, Aurora, Ill. Filed July 29, 1882. (No model.) Issued Nov. 7, 1882.

267,123. GRATE BAR. Hawley Adams, New York, N. Y. Filed Sept. 9, 1882. (No model.) Issued Nov. 7, 1882.

267,128. HOT-AIR REGISTER. James S. Bailey, Brooklyn, N. Y. Filed May 16, 1882. (No model.) Issued Nov. 7. 1882.

267,129. GRATE. John C. Bard, Albany, assignor of one-half to John C. Hoffman, New York, N. Y. Filed Sept. 7, 1882. (No model.) Issued Nov. 7, 1882.

267,133. FILTERING-FUNNEL. Henry Bell, Baltimore, Md. Filed Mar. 14, 1882. (No model.) Issued Nov. 7, 1882.

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

Notes and Abstracts.

Of an urban population of 6,960,768, there died during the week ending March 10, 3.028 persons, which is equivalent to an annual death rate of 22.4, which is slightly less than it was during the preceding week.

For the North Atlantic cities the death rate was 20.8; for the Eastern cities 23.9; for the lake cities 17.1 for the river cities 20.8; and in the Southern cities, for whites, 20.3 and for the colored 40.1.

Consumption caused 19.2 per cent. of all deaths in the North Atlantic cities; 15.9 in Eastern cities, 12.2 in Lake cities, 17.7 in river cities, 22.9 in Southern cities for the whites and 16.6 for the colored.

Diphtheria caused 3.9 per cent. of the deaths in the North Atlantic cities, 3.1 in Eastern cities, 6.8 in the lake cities and 3.5 in the river cities. The high rate from this disease in the lake cities would be decidedly higher if croup were included, since the deaths reported as due to croup form 3.5 per cent. of the whole in this region.

Typhoid fever caused one per cent. of the deaths in the North Atlantic cities, 1.8 in the Eastern cities, 1.2 in the lake cities and 2.8 in the river cities.

Scarlet fever caused one per cent. of deaths in the North Atlantic, 2.5 in the Eastern, 3.5 in the lake, 5.8 in the river, and 2.2 in the Southern cities.

Digitized by Google

PITTSBURG, PA.—Dr. Snively reports three new cases of small-pox.

BOSTON, MASS.—C. E. Davis, Jr., reports 24 cases of diphtheria, 23 of scarlet fever, five of typhoid fever, and one of small-pox.

MILWAUKIE, WIS.—Dr. E. W. Diercks reports 15 new cases of scarlet fever and nine of diphtheria.

DETROIT, MICH.—Dr. O. W. Wright reports 26 cases of diphtheria and 21 of scarlet fever.

SANDWICH, ILL.—Dr. Nahum E. Ballou reports the continuance of scarlet fever.

PEABODY, MASS.—Dr. Chas. C. Pike reports an extensive epidemic of measles; owing to severe weather, probably, several deaths have occurred therefrom.

ROCK ISLAND, ILL.—Dr. G. G. Craig reports four deaths during the week ending March 10. No mortality from zymotic diseases.

BALTIMORE, MD.—During the week ending March 10 the deaths numbered 188 as against 140 during the corresponding week of last year; males 97, females 91; under five years, 65; over 60 years, 35. Annual rate, as calculated by the local authorities, for the whole population 23.90; for the whites 21.00; for the colored 40.73. Small-pox caused 15 deaths, consumption 37, bronchitis three, pneumonia 17, congestion of lungs one, croup seven, diphtheria 13, diarrhœal diseases three, puerperal fever one, erysipelas two, scarlet fever two, malarial fever one, cerebro-spinal meningitis three, and violence seven. No deaths are recorded from measles, whooping cough or typhoid fever.

NEW YORK CITY LUNATIC ASYLUM, BLACKWELL'S ISLAND.—Dr. Franklin reports for the week eight admissions, one discharge, one death, and 1,338 insane persons remaining under treatment.

MICHIGAN.—Dr. H. B. Baker, Secretary State Board of Health, reports the prevalence of the following diseases during the week ending March 3. Bronchitis, consumption, neuralgia, rheumatism, influenza, intermittent fever, pneumonia and tonsilitis. Diphtheria was reported present at 12 places, scarlet fever at 16 places, measles at nine places, and small-pox (one case) at Detroit.

HUDSON CO., N. Y.—Mr. Avoney's report for the week ending Mar. 3 was received too late for tabulation. The deaths from all causes numbered 106, of which one was caused by accident, 18 by consumption, five by croup, two by diarrhœal diseases, six by diphtheria, one by erysipelas, three by typhoid fever, three by scarlet fever, ten by pneumonia, two by congestion of lungs, five by acute bronchitis, two by pleurisy, one by measles and six by puerperal diseases. No deaths were recorded from cerebro-spinal meningitis, malarial fevers, small-pox or whooping cough.

NEW ORLEANS, LA.—During the week ending March 3, there occurred 124 deaths; whites 71, colored 53. Death rate whites 22.57, colored 45.97. Under five years, whites 19, colored 17; over 60 years, whites 14, colored 6.

Among the whites small-pox caused ten deaths, measles one, scarlet fever two, typhoid fever one, malarial fevers three, diphtheria two, whooping cough one, consumption seven, bronchitis one, pneumonia one, diarrhœa two, puerperal convulsions two and violence six.

Among the colored population small-pox caused 17 deaths, cerebro-spinal fever two, consumption five, bronchitis, pleurisy and pneumonia three each and violence one.

PORT OF NEW YORK. The immigrant report of Dr. Wm. Manlius Smith, Health Officer, for the week ending March 2, states that one convalescent from small-pox and three cases of a suspicious character were taken from the S. S. "Ptolomy," recently arrived from Rio. The three doubtful cases were placed under observation, and on the development of the eruption were sent to hospital at Blackwell's Island.

BOSTON, MASS.—The monthly report for February of Dr. S. H. Durgin, Chairman of the Board of Health, a summary of which will be furnished hereafter, gives a statement of the contagious diseases reported to the Board as compared with that for the corresponding month of 1882:

	Feb., 1883.	Feb., 1882.
Cases of diphtheria,	132	118
" small-pox,	0	7
" scarlet fever,	82	41
" typhoid fever,	22	20

ROCHESTER, N. Y.—In his report for the month of February which will be tabulated hereafter, Dr. Wm. F. Sheehan, health officer, says: "The mortality for February is remarkable for a decrease in the number of deaths from zymotic causes and an increase in the fatal diseases of the local class. In other words there was a diminished number of deaths from diphtheria, while typhoid fevers, the cause of eight deaths in January, disappears altogether from the mortality list. On the other hand, the deaths from acute lung and heart disease almost double those of the same class for January. Attention is directed to the small number of births returned for February, giving an annual rate per 1,000 of 19.9 only. The English tables place the birth rate at 36.00 per 1,000 annually; hence it would appear that Rochester is almost half as prolific as England, or else all Rochester's births are not reported to the health officer. I am convinced the latter is the cause of our small birth rate."

CHARLESTON, S. C.—The annual report for 1882 of the Department of Health, Dr. H. B. Horlbeck, Registrar and Secretary, shows a total of 1,726 deaths; white, males 275, females 279, total 554; colored, males 552, females 620, total 1,172. Estimated population 52,286; whites 25,000, colored 27,286. Ratio per 1,000, whites 22.32, colored 42.91, whites and colored 33.01.

White: Under five years 147, over 60, 120. Accidents caused nine deaths, bronchitis 11, consumption 72, croup four, diarrhœal diseases 27, diphtheria 17, malarial fevers 17, scarlet fever 10, typhoid fever 15, congestion of lungs 13, pneumonia 16, and whooping cough 21.

Colored: Under five years 500, over 60 years 97. Accidents caused 14 deaths, bronchitis 16, croup two, consumption 206, diarrhœal diseases 50 (elephantiasis one), erysipelas one, diphtheria seven, malarial fevers 21, scarlet fever three, typhoid fever 38, puerperal fever four, congestion of lungs 24, pneumonia 58, and whooping cough 59.

ONTARIO, CANADA.—The *Provincial Bulletin*, for the week ending March 3, shows a high degree of prevalence of disease of the respiratory organs. Zymotic diseases show no evidence of increase except in the case of measles. Some schools have been practically closed by its prevalence. Had early precautions been taken by parents and school authorities to prevent the children of infected families attending school, such undesirable results would in most cases have been avoided.

NEW BEDFORD, MASS.—The fourth annual report of the Board of Health of the city for the year ending Dec. 31, 1882, states that the number of death certificates presented and approved has been 606. It is estimated that the population at this time is not less than 30,000, making the death rate not over 20 per thousand. The decrease in the number of cases reported of zymotic diseases is very marked at the following extract will show:

	1880.		1881.		1882.	
	Cases.	Deaths.	Cases.	Deaths.	Cases.	Deaths.
Diphtheria.....	231	47	85	3	41	5
Scarlet fever	375	47	160	9	67	4

HAVANA, CUBA.—Dr. D. M. Burgess reports 566 deaths for the month of February. Yellow fever caused 10 of the deaths, typhoid fever 13, malarial fevers 24, small-pox two, and diphtheria five. All excepting one of the decedents by yellow fever were inmates of the military hospital.

CITY OF MEXICO, MEXICO.—The report for the week ending Jan. 28 shows 216 deaths (inclusive of three still births); under five years, 90; over 70 years, five No deaths are reported from measles, scarlet, malarial or puerperal fevers. Diphtheria and croup caused three deaths, whooping cough two, typhoid fever 12, consumption 21 and pneumonia and bronchitis 52.

TEHUANTEPEC, MEXICO.—John A. Sutter, Jr. of Acapulco, transmits a report by Consular-Agent Albert Langner, of Tehuantepec, of the epidemic of choleraic disease which prevailed in December last. During the four weeks of prevalence 1,400 people died in a city the population of which was only 15,000. In individual cases the disease ran a course of from two to three days, some, however, were fulminant and reached a fatal issue in a few hours, with many of the symptoms of Asiatic cholera.

BUENOS AYRES, ARGENTINE REPUBLIC.—The *Monthly Bulletin* for December shows a mortality of 598; males 304, females 294; under five years 375, over 60 years 39. Small-pox caused 97 of the deaths. measles 11, scarlet fever two, croup and diphtheria 18, typhoid fever seven, pneumonia 44, consumption 37, whooping cough four, and dysentery eight.

RIO DE JANEIRO, BRAZIL.—Consul-General C. C. Andrews reports for the week ending Jan. 27, 234 deaths in a population of 330,000. Small-pox caused 18 of the deaths, typhoid fever two, pernicious fever eight, and pulmonary consumption 26.

"A few deaths from yellow fever now occur here each week, but no apprehension is felt that the disease will spread as in 1880."

ENGLAND.—During the week ending Feb. 24 the annual rate of mortality in the 28 great towns of England and Wales averaged 22.7 per 1000 of their aggregate population, Brighton giving the smallest rate, 13.6, and Wolverhampton the largest, 32.3. No deaths was referred to any of the principal zymotic diseases either in Brighton or Plymouth. Small-pox caused eight deaths in London. one in Portsmouth, one in Hull. and one in Newcastle-on-Tyne.

London.—Births 2,759, deaths 1,554. The annual mortality rate which had been equal to 21.7, 21.5, and 20.1 in the three preceding weeks was this week 20.5. Small-pox caused six deaths (and two in the suburban districts) measles 28, scarlet fever 36, diphtheria 18, whooping cough 28, typhus one, typhoid fever 13, diarrhœa and dysentery 12, and violence 54. The deaths referred to diseases of the respiratory organs, which had been 390 and 401 in the two preceding weeks, declined to 366 or to 161 below the corrected weekly average.

SCOTLAND.—During the week ending Feb. 24 the death rate in the eight principal towns was 27.4 per 1,000, or 4.8 above that for the corresponding week of last year and 1.6 above that for the previous week of the present year. Aberdeen gave the lowest rate, 16.6 and, Glasgow the highest, 33.3, whooping cough continues to be the most fatal epidemic, the mortality from it being greatest in Glasgow, Dundee and Greenock, where 32, 11, and six deaths, respectively were referred to it.

Edinburgh.—Total deaths during the week 91; rate 20.0. Diphtheria caused four deaths, whooping cough two, diarrhœal diseases two, acute lung diseases 16, and violence two. No death was registered from small-pox. measles, scarlet fever or typhoid fever.

IRELAND.—Consul A. B. Wood of Belfast transmits with his report the return of the Registrar-General for the week ending Feb. 24.

Dublin.—Mortality 232. Annual rate 34.5. No deaths are reported from small-pox, measles or scarlet fever. Typhus fever caused four deaths, enteric fever three, whooping cough nine, diphtheria one, consumption 21, acute lung diseases 73, and violence six.

Belfast. Mortality 137. Annual rate 33.3. No deaths are recorded from typhus or diphtheria. Small-pox caused one death. measles two, scarlet fever ten, whooping cough six, enteric fever and dysentery two each, consumption 18, acute lung diseases 35 and violence six.

PARIS, FRANCE.—During the week ending Feb. 21 1,198 deaths were registered; males 620, females 578; under five years 353, over 60 years 255. Annual rate 27.79. Typhoid fever caused 34 deaths, small-pox 11, measles 23, scarlet fever two, whooping cough seven, diphtheria and croup 38, erysipelas six, puerperal infection three, consumption 224, bronchitis 52, pneumonia 95, and violence 26.

On Feb. 18 there remained under treatment in the hospitals 78 cases of small-pox, 359 of typhoid fever and 49 of diphtheria.

The continued high mortality is due to the fatality of acute and chronic diseases of the respiratory organs.

LYONS, FRANCE.—Consul B. F. Peixotto reports for the week ending Feb. 10 the occurrence of 210 deaths in a population of 376,000, all due to consumption, in excess of the number of the previous week.

RHEIMS, FRANCE.—Consul Jno L. Frisbie reports 46 deaths for the week ending Feb. 17 males 21, females 25; under 5 years 23, over 60 years eight; population 93,823. Croup-diphtheria, typhoid and puerperal fevers and erysipelas caused one death each, bronchitis caused eight deaths, pneumonia none, pleurisy one, consumption three. No deaths are recorded from measles, scarlet fever. whooping cough or small-pox.

ROTTERDAM, NETHERLANDS.—Small-pox continues in this city. Of 86 deaths reported by Consul Jno. F. Winter during the week ending February 24 seven were caused by this disease. Thirteen new cases were recorded.

GHENT, BELGIUM.—Vice-Consul A. Lefebvre sends the report for the month of January. Deaths 371. Population 136,923. Small-pox caused two deaths, typhoid fever seven, consumption 41, bronchitis 63, diarrhœal diseases 59. In view of the occurrence of the small-pox cases the mayor of the city has issued a notice calling upon the people to get vaccinnated.

During the year 1882 there were registered 4,613 births; males 2,318, females 2,295, and 3,283 deaths exclusive of 167 still-births; males 1,686, females 1,595.

BRUSSELS, BELGIUM.—The bulletin for the week ending February 17 records 175 deaths in the city and its suburbs, equal to an annual rate of 22 o per 1,000. The deaths under five years numbered 50. Small-pox caused five deaths, measles two, scarlet fever one, croup three, typhoid fever three, whooping cough one, diarrhœal diseases 15, bronchitis and pnenmonia 28 and consumption 23. The births during the week numbered 298 equal to an annual rate of 37.1 per 1,000 living.

STOCKHOLM, SWEDEN.—Consul Elfwing transmits report for the week ending February 10 which shows 106 deaths; males 50, females 56; under five years 39, over 60 years 12. Annual rate 31.7 No deaths are reported from small-pox, whooping cough, puerperal fever or violence. Measles caused seven deaths, scarlet fever two, diphtheria and croup four, typhoid fever two, diarrhœa five, consumption 19, pneumonia 15 and bronchitis seven.

During the week ending February 17 the following cases were reported: of dysentery, small-pox, pleurisy, none, of measles 73, scarlet fever 31, typhus fever two, typhoid fever two, puerperal fever one, erysipelas three, whooping cough 11, diphtheria seven, diarrhœa 29, tonsilitis 13, pneumonia ten and acute bronchitis 95.

COPENHAGEN, DENMARK.—There were 125 deaths during the week ending February 13; under five years 60, over 60 years 19. No deaths are reported from measles, scarlet fever, small-pox, typhoid fever or puerperal fever. Diphtheria caused three deaths, croup two, whooping cough five, diarrhœa one, erysipelas one, consumption 16, pneumonia 11, bronchitis 12 and violence none.

The following cases were reported during the same period: measles eight, scarlet fever 20, diphtheria four, croup four, whooping cough 51, typhoid fever three, diarrhœa 104, erysipelas 24, puerperal fever two, bronchial catarrh 508, pheumonia 51 and tonsilitis 165.

VIENNA, AUSTRIA.—Consul-General Weaver sends the report for the week ending February 17 which records 489 deaths, equal to an annual rate of 33.9 per 1,000 of the population. Small-pox caused four deaths, measles none, scarlet fever six, diphtheria five, whooping cough eight, typhoid fever four, typhus fever three, consumption 114, acute diseases of the lungs 90. Of the deaths 167 occurred in children under five years of age.

ST. PETERSBURG, RUSSIA.—Consul-General Stanton's report for the week ending February 10 shows 706 deaths; males 387, females 319 under five years 313, over 60 years 75. Population 929,525. Of the deaths 18 were caused by small-pox and 37 by fever. There remained February 11 under treatment in the hospitals of the city 1,179 cases of fever, 103 of small-pox and 1,248 of venereal diseases.

MALARIA.

FORT MASON, SAN FRANCISCO, *Feb.* 10, 1883.

To the Editor of THE SANITARY ENGINEER:

I enclose two letters from Col. Geo. H. Mendell, of the Engineer Corps U. S. A., which contain observations of value with reference to the malaria question. You are at liberty to use them as you think best.

Yours respectfully, GEO. M. STERNBERG.
Surg. U.S.A.

U. S. ENGINEER OFFICE, NO. 533 KEARNEY STREET, SAN FRANCISCO, CAL. *February*, 2, 1883.

GEORGE M. STERNBERG, M.D., *Surgeon U.S.A.*

Dear Sir:—The allusion you make to animals being subject to malaria, in your last paper in the THE SANITARY ENGINEER, leads me to say that I have been informed more than once by intelligent persons at Bakersfield, Kern County, Cal., that cattle suffer very much from malarious disease on the irrigated lands owned by J. B. Haggin of this city. Very respectfully,
G. H. MENDELL.

U. S. ENGINEER OFFICE, NO. 533 KEARNEY STREET, SAN FRANCISCO, CAL. *January* 20, 1883.

DR. GEORGE M. STERNBERG, *Surgeon U.S.A.*

Dear Sir:—I am led by reading your interesting paper in THE SANITARY ENGINEER on malaria, to give you my own conclusions, drawn from a somewhat extended acquaintance with the great valley of California, over the whole of which malaria prevails, often in most violent forms. It exists in uplands remote from marshy districts,

Digitized by Google

and I have known limited districts of upland adjacent to each other, malaria prevailing in one while absent in the other.

Some years ago, while engaged in a study of irrigation then beginning to be applied on the dry plains of California I was led to notice the level of standing water in wells, in reference to which there is a great difference in our interior plains. I soon noticed that shallow wells and malaria were frequent companions. Where the wells were 70 feet, or thereabouts, deep, there was freedom from malaria. Having noticed these coincidences, I afterwards investigated their occurrence in a great many cases by inquiries of farmers, with whom I had conversation. In one or two cases of exceptional malarial districts in the foot hills, which are generally free from this pest, I found the water in the wells near the surface. I do not recall a single instance of shallow wells where the family were free from fevers, always intermittent I believe. I therefore connected the presence of water near the surface of the ground with the existence of malaria. Whether it is due to the mere presence or to the fact that it is drunk, or to both, I am unable to say.

While I hardly hope by this letter to add to the sum of human knowledge on this subject, I believe I do no harm in stating the results of a little investigation, altogether outside of my professional line, which, however, was quite interesting to me. Very respectfully.

G. H. MENDELL.

MORTALITY STATISTICS.

NEW YORK, *Feb.* 27, 1883.

To the Editor of THE SANITARY ENGINEER:

In connection with your weekly reports of the mortality in cities, I read: "The population in this table are calculated to the middle of the sixth half-year from the date of the taking of the last census, that is, to March 1, 1883."

If not too much to ask will you please favor me with—

1st, The date of the last census.

2d, The rule by which you calculate the populations at any given time.

3d, The populations of New York City and Brooklyn, respectively, at date of last census.

A reply will greatly oblige, Yours truly,

R. F. HATFIELD.

[1. Date of last census June 1, 1880.

2. It is assumed that the rate of increase found by a comparison of the census tables of 1870–80 will continue during the ten years '80 to '90. If that rate is x per cent. the increase for the ten years ending June 1, 1890 will be x per cent. of the population as given by the census of 1880, and the increase for any given parts of the ten years will be a proportionate part of the decimal increase. This mode of calculation gives theoretically accurate results at the beginning, middle and end of the decennial period, but during the first five years there is a plus error, while during the last five years there is a corresponding minus error. These estimates are necessarily only approximative.

3. New York City, 1,206,299. Brooklyn, 566,963.

This matter of estimating the population will be discussed in a series of papers on Vital Statistics, which will soon be commenced in THE SANITARY ENGINEER, and a more accurate formula will be given. The method now used is a short and easy one and sufficiently accurate for the purpose to which it has been applied.]

Persons who feel friendly to this journal can do it a service by examining its advertising columns, and, whenever they see anything of interest there, by mentioning the paper when they write to the advertiser.

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

ANTICIPATING a large demand for really first-class — LABORATORY PRODUCTS, — which shall meet the strictest requirements of the New Pharmacopœia, we have greatly increased our manufacturing department.

Our laboratory is in charge of a gentleman of recognized prominence in his profession, and with the command of ample facilities, we can offer a line of preparations that can be implicitly relied on as of the proper strength and purity.

W. H. SCHIEFFELIN & CO.

NEW YORK:

Pure Sugar
vs.
Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

HAVEMEYERS & ELDER.
DECASTRO & DONNER REFINING CO.

JAS. G. HILL, *Supervising Architect*

Publications.

THE CENTURY
FOR APRIL.

SIX FULL-PAGE ILLUSTRATIONS.

W. D. HOWELLS's new novel, "A Woman's Reason," begun in February, is continued in this number. The story is attracting wide attention, and the first editions of both the preceding numbers, containing the opening chapters, were exhausted almost immediately upon issue. New editions are now ready, and copies may be had of dealers or the publishers. New subscribers should begin with February and secure this story entire.

The April CENTURY also contains:

The Capitol at Washington, by BEN: PERLEY POORE. An interesting anecdotal and descriptive article, including reminiscences of many eventful scenes in the Capitol. Among the numerous illustrations are striking portraits of DANIEL WEBSTER and JOHN RANDOLPH.

Emerson. An appreciative and critical essay by E. C. STEDMAN, dealing mainly with EMERSON as a poet, with portrait engraved by COLE from a daguerreotype of EMERSON in the prime of life.

The Song of Songs. A scholarly article by Ellice Hopkins, discussing Solomon's Song from the point of view now generally accepted in Biblical criticism.

Eugene Fromentin. A biographical sketch of the famous French writer and painter of Oriental scenes, by HENRY ECKFORD; with full-page reproductions of two of his paintings.

The Passion Play at Oberammergau. A charming, picturesque paper by "H. H."

At Sea. By JOHN BURROUGHS; accompanied by a full-page engraving drawn with the graver, by ELBRIDGE KINGSLEY. This is the picture so highly commended by Dr. SEYMOUR HADEN in a recent lecture in New-York.

Plotters and Pirates of Louisiana. By GEORGE W. CABLE. A graphic sketch of the pirates of Barataria, whose leaders were the notorious Lafitte brothers, with illustrations.

Visiting the Gypsies, by CHARLES G. LELAND, with pictures by JOSEPH PENNELL,

The Other Contents include the last chapters of Mrs. BURNETT's novel, "Through One Administration," "Anastasia," a short story by H. H. BOYESEN, an illustrated paper by BARNET PHILLIPS on "The Primitve Fish-hook," poems, departments, etc., etc.

Price, $4.00 a year; 35 cents a number, For sale by all dealers.

Digitized by Google

The following back numbers of THE SANITARY ENGINEER are worth preserving, and will be sold at prices quoted until further notice :

ebruary, 1878 ..... 50 cents.
ontains an article on "Plumbers' Profits." Useful when a plumber's bill is disputed, as showing what percentage of profit is necessary and legitimate.

pril, May, June, July ..... } for the set $1.00
and October, 1878 ..... } or 20 cents each.
hese issues contain articles from E. S. Philbrick, C.E., on "The Ventilation of the Public Sewers;" Robert Briggs, C.E., on "Heating and Ventilation," and Col. Geo. E. Waring, Jr., on the "Sanitary Aspects of Plumbing."

December, 1878, and January, 1879 ..... each 30 cents.
Article on the Electric Light, by Prof. Henry Morton, President of Stevens' Institute of Technology, "Terms of the Competition for Improved Tenement Houses." Articles on the "Water Supply of Small Towns," by E. S. Philbrick, C.E., "Ventilation of the Capital at Washington," by Robt. Briggs, C.E. "Sanitary Condition of Tenement Houses," and Irvington Sanitary Survey," by Col. G. E. Waring, Jr.

March, 1879 ..... $1.00
Contains "Prize Plans in Tenement House Competition," with report of Committee of Award; a history of the movement which led to the passage of the Tenement House Act in New York.

March, April, May, June 1 and 15, and July 1, 1879, only a few left ..... for the set $4.00
This series contains the ten selected plans on the "Model Tenement House Competition."

May, 1879 ..... 50 cents
Has article on the "Holly System of Steam Heating," by Robt. Briggs, C.E. Article on the "Water Supply of Small Towns," by E. S. Philbrick, C.E., and seventh and eighth "Prize Plan in Tenement House Competition."

August 1, 1879 ..... 30 cents
"Plan and Description of a Model Paris Apartment House," by Lewis W. Leeds. Article No. 3 on "Domestic Sanitation," by E. S. Philbrick, C.E.

September 1 and 15, October 15, November 1 and 15, 1879 ..... each 30 cents
In this series is an illustrated description of the "Heating and Ventilation of the Utica Insane Asylum;" article on "Food Adulteration Abroad," by Prof. Henry Morton; "Domestic Sanitation," by E. S. Philbrick, C.E. Articles on "Water Gas—Its History and Manufacture," by Prof. Henry Morton, Ph.D. "Sanitary School Construction," by Dr. D. F. Lincoln; an opinion on the "Validity of the McCloskey Patent," by J. N. McIntire, Patent expert.

March 1 and 15, April 15, 1880 ..... each 50 cents
Valuable, as they contain results of "Model School House Competition," with report of the Committee of Award, and eight of the Prize Plans.

May 1 and 15, 1880 ..... each 50 cents
Very valuable for reference, as they contain full report (illustrated) of Dr. Carmichael, of Glasgow, on his experiments to test the liability of sewer gas and disease germs to pass through a water seal trap. Often referred to.

October 15 and November 1, 1880 ..... each 50 cents
An account of the "Heating and Ventilating Arrangements of the Madison Square Theatre;" "How to Utilize Exhaust Steam to Heat a Factory" (Illustrated). "English Adulteration Acts," by G. W. Wigner, F.C.S. An illustrated description of the Sewerage of Memphis.

December 1, 1880 ..... 50 cents
Contains report of the Committee of Award in the "Food Adulteration Competition;" an article on "Recent History of Electric Lighting," by Prof. Henry Morton. A review of schemes for the sewerage of Newport, R. I, "Arsenical Wall Paper," by Dr. E. S. Wood, of Harvard Medical College.

May 15, 1881 ..... 50 cents
A Review of Prof. Pumpelly's report on the filtering capacity of soil; an article on the "Safety of Theatres," by Jas. Harrison, Superintendent of the Board of Fire Underwriters, N. Y. A plan for removing ground water from a city house to the sewer (illustrated). A sectional plan of fitting up a Double Hot Water Boiler, as done in New York.

August 1 and 15, and September 1, 1881 ..... each 25 cents
Contains letters and articles giving full account of the system of Disposing of Refuse and Sewage at Birmingham, England.

October 1 and 15, and November 1 and 15, 1881 ..... each 25 cents
Review of Col. Waring's article in *Scribner's* on the "Drainage of New York." Article No. 1 on the system of "Water Waste-Prevention in Liverpool." Plan and description of a Sewer Weir and Geometrical Stair Case, designed by Sir Jos. Bazalgette, London; the Municipal Chemical Laboratory of Paris, by Dr. De Pietra Santa.

The Durham House Drainage Co.

IS prepared to contract for the supply and construction in place, of drainage on the Durham System, in new buildings, of all classes and for all purposes, at any point, and for the removal and replacement of defective drainage work by the improved system.

This Company does *only one class of work*, whether intended for the smallest cottage or a large public building, and whether by contract or by day's labor. We desire particularly to interest and serve that large class of intelligent people to whom cost is an object.

This Company not only manufactures the materials it uses (excepting pipes), but it invariably constructs the drainage system complete, with its own workmen, and under the supervision of its own engineers.

In addition to the perfect system of construction which we offer to the public, we are further entitled to its confidence from the fact that this Company does not licenes individuals over whom they could have no control, to construct drainage on the Durham System. We decline to sell our special fittings to be used independently of our knowledge or control. It is a cardinal principle in our business that we must know personally that every piece of work bearing our name is thoroughly well done.

JENKINS' PATENT

(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

INSIDE VIEW OF GATE VALVE.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

—SAMPLE ORDERS SOLICITED.—

THE BRIGHTON.

There is a tendency in some quarters to demand a Hopper form of Water Closet and to dispense with what are called mechanical parts. This would be desirable, if the so-called mechanical parts did not secure advantages in the matter of a large body of water in the bowl, not otherwise obtainable, without resorting to methods not everywhere applicable or sufficiently demonstrated as practicable.

The Brighton Closet here illustrated is, we believe, the best compromise yet devised between the Hellyer form on the one hand and the Hopper on the other.

By examining the sectional cut, it will be seen that the bottom of the bowl is covered with water, while the flush and shape of the bowl is such that the trunk on the back is kept clean.

It is attractive in appearance, being all in one piece, of white earthenware.

The pipe *B*, connected with the trunk, can be run into a heated flue when desired.

These Closets have had a large sale in England during the past four years. We have had them in use in our factory nearly two years—and we now offer them to those who prefer a different form of Water Closet than the *Hellyer, which, by the way, does not, in a single instance, so far as we know, fail to satisfy those who have them in use.*

This will be known as

"Meyer, Sniffen & Co.'s Water Closet Apparatus No. 30."

Persons interested are invited to call at our warerooms, Nos. 46 and 48 Cliff Street, New York, or at No. 1 Pemberton Square, Boston, and examine this and other specialties that we have fitted up with water attached, including THE ROYAL PORCELAIN BATH, THE MODEL PORCELAIN SLOP HOPPER, THE HELLYER CLOSET AND HOPPER, THE RHOADS HOPPER, DOHERTY SELF-CLOSING COCKS, FULLER FAUCETS, etc.

CREQUE'S PATENT CIRCULATION

Digitized by Google

NEARLY three years ago the undersigned introduced to the trade in this country THE ROYAL PORCELAIN BATH.

Prior to that period it was little known, except to those Americans who may have seen them when traveling in Great Britain; while it is true that they had been used there for 25 years, and were universally conceded to be the finest thing in the way of a Bath Tub known, yet, like all things supposed to be new and of high cost, they required extensive advertising to secure their acceptance and use to any considerable extent in the United States.

The effect of numerous expressions of opinion, made without either knowledge or experience to justify them as to their durability and utility, had to be counteracted, yet, as a result, we have succeeded in having them selected for some of the most elegant residences that have been erected within the past ten years. They have also been used in several hospitals, for which places we make a special, less elaborate, and cheaper class of fittings.

A personal inspection will convince any one of their superiority. Their increased cost over that of an ordinary copper-lined bath tub should not be a consideration to those who can afford to live in a house worth over $15,000, and would not be if their cleanliness, inviting appearance and durability was appreciated.

MEYER, SNIFFEN & CO.

46 & 48 Cliff Street,
New York.

N. B.—We have imported a line of sinks, which are made of the same non-absorbent material as the ROYAL PORCELAIN BATH TUBS. They are admirable for Hospitals. They have been used in some of our elegant New York residences, where their expense was no objection. They are one and one-half inches thick, and are less likely to be broken than cast iron. We have a size in stock that would make an admirable "Foot Bath."

THE KITCHEN BOILER
AND WATER PIPES.

A few words on their Arrangement and Management; more especially their treatment during Frost, and how to avoid Explosions. By H. Grimshaw, F. C. S., late Demonstrator in the Laboratory of the Owens College, Manchester. Price, 40 cts.

For sale by Book Department, The Sanitary Engineer, 140 William Street, New York. P. O. Box 3037.

THE "DU BOIS" TRAPS.

These Celebrated Traps are made in th same way as lead pipe—Sound and Smooth Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

SECTIONAL VIEW OF VALVE.

BENNOR
Syphon Trap

Will recommend itself to
Architects, Plumbers and Sanitary Engineers.

Because: First—It is a perfect seal under all circumstances, with or without water.

Second—By the peculiar construction of the valve in connection with its syphoning force, the trap and adjoining pipes are kept clean and free of coating.

Third—It cannot become clogged.

Fourth—It is simple, durable, cheap and easily adjusted.

BEDELL'S
IMPROVED
IRON SEWER GAS
AND
BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

Directory List.

*ELEVATORS.—Hydraulic, Passenger, Freight and Side-*walk Elevators, m'f't'd by the *Granville Hydraulic Elevator Co.*, 1193 Broadway, N. Y. Send for Illustrated Circular.

GREEN HOUSE HEATING BY STEAM.—Gillis & Geoghegan, 116 and 118 Wooster Street, New York, N. Y.

INJECTORS.—Nathan & Dreyfus, 94 *Liberty St., N. Y.* Oil cups, Lubricators, etc. Send for Catalogue. P. O. Box 3746.

MATHEMATICAL INSTRUMENT MAKERS.— Young & Sons, 43 N. 7th Street, Philadelphia. Patented Improvements on Levels, Transits, etc. Manual and Catalogue upon application.

PLUMBERS' BRASS WORK.—Fine Goods. Special prices. Hedges & Bro., Newark, New Jersey.

PLUMBERS' SUPPLIES.— Meyer, Sniffen & Co., 46 and 48 Cliff St., N. Y. The Hellyer Water Closet and Royal Porcelain Bath Tub.

STEAM BOILERS.—The Babcock & Wilcox Co., 30 Cortlandt St., N. Y. Manufacturers of Safe, Economical and Durable Water Tube Steam Boilers.

WROUGHT IRON PIPE.—Pancoast & Rogers, 28 Platt St., N. Y. Wrought Iron Pipe, Boiler Tubes, Cast Iron Water and Gas Pipe. See advertisement.

THE BOWER
SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

B. P. BOWER & CO., Manufacturers, Cleveland, O

"COFFEE."

FROM PLANTATION TO CUP.

A BRIEF HISTORY OF
COFFEE PRODUCTION AND CONSUMPTION.

With an Appendix containing letters written during a trip to the coffee plantations of the East, and through the coffee consuming countries of Europe.

LONDON, 1862.

PARIS, 1867.

"IMPERIAL"

Porcelain Wash Tubs,

PARIS, 1878.

Manufactured in England exclusively for, and Imported only by

THE J. L. MOTT IRON WORKS,

88 and 90 BEEKMAN STREET, NEW YORK.

"IMPERIAL" WASH TUBS.—No Covers.

The above illustration shows the "Imperial" Porcelain Wash Tubs set up without covers, and with Faucets over top, which is now considered the most approved style of fitting these Tubs, as it not only gives more room inside, but admits of a much better arrangement of the supply pipes, getting them over the Tubs, instead of behind, where they can be ıdily got at in case of leak or necessary repairs. A sliding cover can also be made for Tubs put up in above manner if desired, although we should very much prefer them just as ɔwn, *i. e.* showing the beautiful clean porcelain surface.

Note.—*When Tubs are wanted to fit up in above manner, please order without Faucet Holes in back.*

"IMPERIAL" WASH TUBS.—With Covers.

Note.—*When Tubs are wanted to fit up in above manner please order with Faucet Holes in back.*

In calling the attention of Architects, Plumbers and others to these Tubs, it is probably enough to say that they are in material and finish in all ɜpects the same as our "Imperial" Porcelain Bath Tubs, being perfectly modelled, delicate and uniform in color, with a glaze which is simply perfect d unapproached by anything of the kind yet made. They should be seen by all who are in the market for such goods, before specifying or purchasing y other kind.

COMPLETE ILLUSTRATED CIRCULARS WITH PRICES ON APPLICATION.

ll our Sanitary Specialties are fitted up with water attached and may be seen at our Warerooms, 88 and 90 Beekman St.

ADVERTISEMENTS 399-408

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

British Subscribers who wish to receive this paper, without interruption should renew their subscriptions a month before expiration, with Messrs. E. & F. N. Spon, London, in order that they may be able to notify the Publisher, in New York, of the fact.

NOTICE.—Correspondents will prevent needless delays and annoyance if they will address all communications, except those of a strictly private nature, to THE SANITARY ENGINEER. Checks should also be drawn to the same order.

We are of the opinion that a commission composed of Samuel D. Babcock, Edward S. Chesbrough, and Hubert O. Thompson, would construct the proposed new aqueduct and dam at Quaker Bridge in three-sevenths the time and for three-sevenths the amount of money that will be required if the commission contemplated in the Daly bill is intrusted with the job.

A meeting of the Sanitary Council of the Mississippi Valley at Jackson, Mississippi, has been called for the 3d of April next.

The failure of appropriations for the National Board of Health makes it impossible to keep up the Mississippi River Inspection Service on the plan which has proved so successful during the last two years, and the Sanitary Council now becomes an organization of great importance.

This council is composed of representatives of the State and Local Boards of Health of the Mississippi Valley, and its recommendations will no doubt govern, to a great extent, the action of these boards as regards communication with New Orleans during the coming summer.

There is throughout the valley such a profound distrust of the Louisiana Board of Health, such a general belief that it will conceal the occurrence of yellow fever to the last possible moment, and so little faith in the protection afforded by the Mississippi River quarantine as administered under its direction, that much interferance with the rail and river communications of New Orleans is to be feared, unless the council can agree upon some practicable plan to preserve public confidence. If the council finds it necessary, in order to secure this confidence, that inspectors selected by itself shall be maintained in New Orleans and at the Mississippi River Quarantine at the expense of the city of New Orleans, we fancy there will not be much enthusiasm in the latter city over the results of the efforts of its representative, Mr. Ellis, to prevent any appropriation by Congress to meet such expenses.

THE BOSTON PLUMBING ORDINANCE.

Boston has at last joined the ranks of those cities which have assumed municipal control over plumbing. The ordinance governing this matter we published on page 367 of our last issue. Unlike the law for this city, which vested the power to make regulations in the Board of Health, the regulations are there prescribed in the ordinance, and the responsibility of enforcing them is placed with the Inspector of Buildings, who was active in securing the legislation. It is always difficult to secure the passage of a law providing in detail for methods of construction or practice, there always being much difference of opinion about details, and the wrangles about minor ones often befog the legislator who has no special knowledge of the matter in dispute; the result too often is a crippling of the entire movement. Under the circumstances, therefore, Boston is to be congratulated for getting what she has, though it is not all that is desirable.

It is to be hoped, though, that what is prescribed will be so intelligently enforced that the advantages of such a law will be made manifest, and the needed additional authority be granted to the parties responsible for its enforcement.

Section Seven of the ordinance provides as follows:

"SECT. 7. Iron pipes, before being put in place, shall be first tested by the water or kerosene test, and then coated inside and out with coal-tar pitch, applied hot, or with paint, or with some equivalent substance. Joints shall be run with molten lead and thoroughly calked and made tight. Connections of lead pipes with iron pipes shall be made with brass ferrules, properly soldered and calked to the iron.

It is not clear how this can be practically carried out; certainly the oil test cannot be made at each building, and the necessary dipping baths, oven, etc., erected. If the inspector accepts paint, that might simplify the matter somewhat. To apply any other substance hot that would be of any value, inspectors would have to be stationed at the various foundries where pipe intended for use in Boston is made, and such pipe would have to bear some stamp. We are a little curious to see how it is proposed to enforce this section.

Sections 6 and 11 are especially good. We regret, however, that all lines of soil pipe, and the fittings on it, over fifty feet in length were not required to be the standard extra heavy pipe, which is one-fourth inch thick; the pipe specified in the law is too thin for the high buildings now being erected. The additional cost of the extra heavy pipe is only for the value of the iron, the labor being the same, and for reasons often stated in these columns, and which every plumber knows, it should not be for a moment considered when the risks to be avoided are taken into account.

We also regret to see an omission to provide for the fresh air inlet to each house drain. Since the main trap is required, this is a very serious omission, and should at once be corrected by an amendment. Without this air inlet the house pipes are partially dead ends, and are deprived of the movement of air through them that is so essential. There are plenty of gentlemen in Boston who know the necessity of this, whose opinions are entitled to consideration, and we shall look for the early correction of this oversight or blunder, whichever it may be.

NEW YORK'S WATER SUPPLY.

No. X.

THE SUPPRESSION OF WASTE.

(Continued from page 362.)

The following letter from the Commissioner of Public Works explains what the Department has been doing in the matter of restricting waste :—

DEPARTMENT OF PUBLIC WORKS,
COMMISSIONER'S OFFICE,
No. 31 CHAMBERS ST., NEW YORK, *Feb.* 21, 1883.

To the Editor of THE SANITARY ENGINEER :

SIR :—In answer to your inquiries in reference to the subject of waste water in this city, I beg to say :

The first practical steps against waste of water were taken in 1876, by establishing a system of house inspection to detect and prevent leaks in plumbing and willful waste in letting water run from faucets unnecessarily.

The next step was the abrogation, in 1877, of the contract or license system of supplying water to shipping, and for building purposes, by which immense quantities of water were wasted along the water front and in the erection of buildings. This service is now under the immediate supervision of competent inspectors, and the greater portion of the water supplied to shipping is measured by meters.

The last and most effective measure against waste is the use of water meters. On January 1, 1877, there were only 260 water meters in use in the city. In 1877 and 1878 the number was increased to 922 ; in 1879 to 1,398 ; in 1880 to 4,002 ; in1881 to 5,293 ; and at this date there are 6,924 meters in use.

The expenditures for the various measures for the suppression of waste are paid from the appropriation for "Repairs and Renewals of Pipes, Stop Cocks, etc.," which is the appropriation for the repairs and maintenance of the entire distributing system, comprising 531 miles of water pipes, with 5,613 stopcocks, and 6,944 fire hydrants.

The Department estimate for this appropriation for the year 1883 was as follows :

Four Repair Companies, each consisting of 1 Foreman, 2 carts, and 21 mechanics and laborers	$82,000
One gang of mechanics and laborers, employed in placing taps in water pipes, and cutting off taps for non-payment of water rents, waste of water, etc	24,000
For new 12-inch and 6-inch pipes, stop cocks, hydrants, fixtures, materials and supplies for renewals and repairs	122,000
For services of Engineers, Meter Inspectors, Inspectors of waste, Supt. and Inspectors on Water Supply to shipping, Clerks on Water Meter accounts, etc	72,000
Total	$300,000

The Board of Estimate and Apportionment in the final estimate appropriated only $170,000.

It is evident that with the constant and rapid growth of the city ; the increased demands on the water service ; the addition of from fifteen to twenty miles of pipe each year to the distributing system ; and the wear of the older pipes and stop cocks, the expense of repairs and maintenance must increase from year to year, and the necessity for further suppression of waste, in order to meet the new demands on the water supply, grows in the same proportion.

For years past the appropriations have been inadequate to afford means for the renewal of the old pipes and stopcocks along the water fronts, which are so reduced by corrosion, from contact with salt water, that they are unsafe.

The measures for the suppression of waste began with the places and establishments where the consumption and waste of water was greatest—the docks, gas works, breweries, malt houses, railroads, hotels, factories, large stables, etc. As the work is extended to the smaller and more numerous business places, it becomes more laborious in proportion to the results which can and which must be attained to keep up an efficient supply.

It will be impossible, with the amount appropriated by the Board of Estimate and Apportionment, to perform the various work and duties referred to, to the extent and with that degree of promptitude and efficiency which the situation calls for.

In carrying out the various measures for the suppression of waste of water the Department now employs—

On Water Meters :—

One General Inspector to examine places after they are metered.

Twelve Inspectors to read meters and keep them in order.

One Inspector to test meters in Pipe Yard.

Three Clerks on meter accounts.

On Waste of Water :—

One General Inspector.

Eighteen Inspectors to examine plumbing in buildings.

Four Inspectors to examine house drains in sewers at night.

One Inspector to examine new buildings.

One Inspector to visit houses where water is found wasting through drains at night.

On Supply of Water to Shipping, etc. :—

One Superintendent.

One Clerk, keeping accounts.

Seven Inspectors, along the water front and at new buildings.

Very Respectfully,
HUBERT O. THOMPSON,
Commissioner of Public Works.

The foregoing omits to state one method adopted to check waste which, after all, is the principal one, aside from the use of the 6,924 meters, that has secured any practical results ; that is, the throttling of the distributing pipe or partial closing of the gates from the Central Park reservoir. The Engineers, some time since, realized that unless they kept the pressure down in the mains, except in case of a fire, the water would be drawn out of the reservoir faster than it could be delivered to it ; in other words, 95 million gallons was all that could run into it in twenty-hour hours. It was therefore necessary to so throttle the distributing pipes as to limit the quantity withdrawn to that amount, or else the city would be without any reserve whatever, a contingency not pleasant to contemplate, with the possibility of breaks in the aqueduct. It may be asked why throttle the pipes and not give us what pressure there is ? We would reply that with the present worn out plumbing and leaking fittings all over this city, and defective pipes under the streets, the leakage would increase as the pressure was increased, and, in our opinion, if a pressure of forty pounds per square inch were maintained throughout the greater part of the city, assuming such a thing possible, the amount of water consumed would be at least one hundred and twenty-five million gallons per day, instead of ninety-five millions as it is now. It is therefore evident that we must do as was done in Norwich, Liverpool, and other English cities, and that is, stop the leaks in the houses and under ground, and keep them stopped, or any additional pressure, when we do get it, will simply increase the waste, and so much of it as soaks in the ground will moisten the soil about our habitations and increase the mortality from lung diseases.

It will be noticed that the Commisioner's letter states that there are twenty-four water waste inspectors besides one general inspector, eighteen of whom are to examine plumbing in buildings. It would be interesting to know how these men occupy their time during the day, for one thing seems very clear, and that is, that from some cause or other these twenty-four men are not working to the best advantage ; and if they are all faithful and competent, there is an evident want of organization and efficiency that needs correction.

No one pretends that the Board of Health Inspectors are overworked, yet a much smaller force have made themselves felt and recognized all over this city.

We have taken a little pains to inquire from those who should know, and we are unable to learn that they have seen or heard of inspectors of plumbing from the Department of Public Works except on rare occasions, and we are of the opinion that these eighteen men are not doing six men's work. We would, therefore, suggest that the Commissioner take about three hours' time some day to investigate the working of this portion of his department ; and we are satisfied that he can institute measures that will secure three times the results that are now or ever have been obtained. This department should demonstrate that it can utilize to the best advantage what it has, before it can with propriety ask for the additional funds and powers that are needed.

With our next article we hope to conclude this series by briefly reviewing the various methods that may be available for checking the abuses from which New York, with other American cities, is suffering, but which at the present time are especially onerous here.

[TO BE CONTINUED.]

DIRECT SUPPLY TO WATER CLOSETS.

We print elsewhere a letter from a plumber of this city, with an illustration, that deserves careful attention. It is probable that the work in this house was begun before the plumbing law went into operation, which was about October, 1881. We have taken the trouble, however, to have a sketch prepared so that all our readers can fully realize the character of the risks incurred when valves on water closets are supplied by branches from the main water supply, from which water for drinking and cooking is drawn. The picture fully illustrates the nasty practice and its very probable consequences, yet water closets are fitted up in this way in great numbers of houses in this city, and aside from the wastefulness of water attendant on this method, the risks to health which have been demonstrated over and over again are such as should compel our health authorities to institute a systematic inspection of all the houses in this city, and they should, as rapidly as possible, require the disconnection of all direct supply to water closets, and the abandonment of the filthy practice that ignorance and cupidity has made so prevalent.

ANOTHER BAD BILL.

The following Bill has been introduced by Assemblyman Roesch, in the New York Legislature, referred to the Committee on Public Health, reported favorably, and is now awaiting passage:

SECTION 1. Section seven, of chapter four hundred and fifty of the laws of eighteen hundred and eighty-one, entitled "An act to secure the registration of plumbers and the supervision of plumbing and drainage in the cities of New York and Brooklyn," is hereby amended so as to read as follows :

§ 7. Nothing herein contained shall authorize the Board of Health of the Health Department of either of said cities of New York or Brooklyn to prohibit the use of vitrified glazed pipe or tile for draining of any building in said cities.

§ 2. This act shall take effect immediately.

We learn that this measure has been quietly put through the Heath Committee, and though it affects the New York Board of Health, they were given no opportunity to be heard, and their knowledge of its existence came from the newspaper notices of the favorable report by the committee.

If it had been referred to a committee, say on "Tile Pipe Manufacture," we should not have been surprised at the action taken ; but how a committee on public health should act on a measure of this kind without consulting the Board of Health, is not explainable on any proper theory.

We do not propose to go all over this tile pipe controversy so far as it relates to the needs and conditions of this city, but we will repeat that the Board of Health, in their regulations permitting its use outside a building, have done all they properly can if the health of the occupants of the houses in this city is to be considered.

The principle involved in legislation of this kind is, however, pernicious, and should not be tolerated. The Legislature has seen fit to place discretion with the Board of Health in the matter of the enforcment of the plumbing law. It is to be supposed that their rules will interfere with some one's desires or interests, and if in every such case a bill is to be passed forbidding the Board to interfere with that interest, the plumbing law had better be repealed. When the fair-minded people of this city, who have only the

Digitized by Google

safety of the occupants of its houses at heart, come to the conclusion that the Board are not wisely or properly exercising the discretion vested in them, then let them have that discretion transferred to those capable of holding the trust. This bill is not for the interest of the public. There is now no restriction on the legitimate and safe use of tile pipe here. The bill should not become a law, and if the Sanitary Reform Society will look to it, we are satisfied our legislators will not pass it.

We should add that this measure has received the condemnation of the Mayor's cabinet.

A NASTY ARRANGEMENT.

NEW YORK, *March* 20, 1883.

To the Editor of THE SANITARY ENGINEER:

I now live in a house in which the plumbing was finished last July and passed by the Board of Health inspector. On the second floor is a valve pan closet. This valve is supplied direct from the rising main to the pump that is intended to pump water into the tanks and over sinks on each floor above. I have seen the pump up-stairs discharge water over the sink when the water closet below was in use that smelled like the contents of the water closet. Of course the closet happened to be in use at the moment, and the valve being open the suction from the pump above drew the foul air from the closet bowl so that the water was impregnated with it. I thought it was against the law to connect any more closets to drinking water mains. How is this?

1,321 Second av. DANIEL RYAN, *Plumber.*

[A comment on the above will be found in our editorial columns.]

BAD DRAINAGE AND FEVER.

Mr. Keith D. Young, A.R.,I.B.A., lecturing before the Society of Medical Officers of Health in London, to illustrate the connection between bad drainage and enteric fever in hospitals, cited the experience of the London Fever Hospital.

Between the years 1855 and 1878, 5,569 patients were admitted into the London Fever Hospital with enteric fever, and 19 inmates of the hospital contracted the disease. Nine of the cases were accounted for by the occurrence of various defective drainage conditions, or other equally direct causes of infection. Of the remaining ten, three only were nurses engaged in the enteric wards; of one, it is said to be doubtful if she contracted the disease in the hospital at all; the other six were four housemaids, one kitchen maid and one scarlatina patient. While it is unfortunate that no evidence exists to show how these ten cases contracted the disease, it is interesting to note that its co-incidence was slightly greater on those whose duties would not bring them into contact with enteric patients than upon those intimately concerned with those patients.

In the autumn of 1881 three nurses and one ward servant, all engaged in the male enteric ward, contracted enteric fever, and co-incident with these cases successive stoppages in the sluice pan took place. The cause was found to be the accidental blocking of a trap by a piece of slate. The defect was remedied, and no further cases occurred.

The Health Officer of Savannah, Ga., Dr. J. T. MacFarland, has this to say about the connection between the sanitary condition of the city and its plumbing:

"The frequent and most important of unsanitary complaints are those relating to faulty house and sewer plumbing. The houses usually reported by tenants are those in which the plumbing work is old, and I have every reason to believe that most, if not all of these complaints, are unfortunately true. I am informed by plumbers that they very frequently, while repairing or refurnishing house pipes, find joints without cement or filling of any kind, and, consequently, so open as to allow the unimpeded flow of sewer gas directly into the houses. No unsanitary condition of a city demands more vigorous surveillance than does this, and I respectfully suggest that an ordinance be created by the Honorable City Council, which will compel owners of property so reported to have sewer connections of same examined by a plumber (when deemed necessary by the health authorities), and promptly placed in perfect sanitary condition when found defective.

"Sewer gas poisoning, to which is attributed the origin of very many fatal diseases, is now engrossing the attention of sanitarians. It behooves our community to look well to the sanitary condition of their homes; faulty plumbing, decay of or accident to pipes connecting with sewers, will necessarily entail serious consequences."

GERMS AND EPIDEMICS.*

(Concluded from page 341.)

You will notice that Pasteur's method of diminishing the virulence of various germs depends largely upon exposing them to the influence of oxygen.

Recently M. M. Nocard and Mollereau have reported that this same attenuation can be produced by mixing the virus with oxygenated water, but much more rapidly than by the method of successive cultures. (*Bull Acad. de Med.*, 1883, 2 sec. V., XII., p 3).

It cannot be said that Pasteur's claim to have established the general rule that inoculation with artificially modified virus will afford protection against the disease is yet to be considered valid. His methods and conclusions have been sharply criticised by Koch, who is certainly a competent judge, and for the present we must suspend judgement. It will probably at once occur to you that vaccine may be in like manner an attenuated virus of small-pox, in fact, Pasteur calls his method vaccination, and it is claimed by some experimenters that true vaccine vesicles have been produced on cows by successive inoculations of virus derived from small-pox. The question is one of much practical importance, but other skilled experimenters have not obtained the same results, and at present the connection is a doubtful one. It has recently been authoritatively announced that Professsors Schütz and Loefler, of the Imperial German Board of Health, have discovered the pathogenic organism of glanders, have succeeded in cultivating it to the production of spores, and with the results of these cultures have produced the disease in sound horses, which is the scientific demonstration that the cause is really the organism in question.

Of the specific contagious diseases of man in which micro-organisms have been found, one of the best marked is the so-called relapsing fever, a disease which has been known in Ireland for over a hundred years, being known there by the terribly significant name of the famine fever; and which within the last century has several times spread widely in epidemic form over Europe and this country. In the blood of persons affected with this disease there are found micro-organisms consisting of extremely delicate threads, varying in length from two to six times the breadth of a blood corpuscle, twisted into a spiral or cork-screw shape, and moving about actively. They are found only during the paroxysms of the fever, and disappear during the intervals. When a little blood containing these spirilla is kept at the ordinary temperature of a room, the organisms will live for several days, but if this blood be kept at the temperature of the human body, say 98° F., they will die in about 18 hours, while if the temperature be raised to fever heat, 104° F., they will survive only about eight hours. Inoculation with blood containing these spirilla causes relapsing fever in a healthy person, but as yet attempts to cultivate the microphyte outside the living body have not been successful, and spore development has not been observed. In form, size and appearance this spirillum is almost identical with a common microphyte found in foul water, and which also has been found in the mouth of a healthy person, but as yet no connection has been traced.

Among the most interesting and practically valuable advances in our knowledge of the relations of micro-organisms to disease in man, are those which relate to the causation of the various disturbances which occur after wounds and injuries, and which are known as septicæmia, pyæmia, erysipelas, wound fever, and puerperal fever; all of which, it now seems probable, are due to the action of the microphytes which are concerned in ordinary putrefaction, and which are to be found almost everywhere. They do not exist in the blood and tissues of healthy men, but are present in enormous quantities on the skin and in the mouth and alimentary canal. The precise method in which they cause disease probably varies somewhat in different cases. Sometimes they act mechanically by collecting in heaps and plugging the

*A Saturday afternoon lecture delivered at the National Museum, Washington, D. C., Feb. 17, 1883, by John S. Billings, Surgeon U. S. Army.

Digitized by Google

smaller vessels, but in most cases they do not multiply in the blood so much as in certain limited localities among the tissues to which they gain entrance through wounds, and it is supposed that the inflammation, suppuration and fever which they produce is due not so much to their mere mechanical presence as to a poison which they produce from the fluids which nourish them somewhat as the yeast plant produces alcohol.

Dr. Ogston, Surgeon to the Aberdeen Royal Infirmary who has for some time been specially studying this subject, thinks that this poison is one of the ptomaines, a peculiar group of alkaloids which are gradually produced in dead bodies by the process of putrefaction. Attention was first called to these compounds in the examination of dead bodies in cases of suspected poisoning when it was found that the application of chemical tests produced results similar to those which might have been expected if the person had been killed by a vegetable poison; in fact, in one case in Italy, the chemists concluded that a man had been poisoned with delphinium, which they supposed they had found in the body, when in fact it was a ptomaine formed in the body after death. Several years ago it was discovered that a decomposing organic fluid, which produced rapidly fatal septicæmia, when injected into the blood vessels of an animal, might be so filtered by passing it through unglazed porcelain, that all the micro-organisms were removed, and that from the structureless liquid thus prepared there could be obtained by evaporation and extraction with alcohol, a substance capable of producing septicæmia and death. This substance was named sepsin, and the ptomaines appear to be much the same thing. In fact, the accounts of the latter in the reports of the French Academy remind one a little of that worthy and learned Professor who discovered that the poems of Homer were not written by Homer but by another man of the same name. These poisons are not themselves capable of growth or reproduction, and it is not certain that they are produced only by microphytes; on the contrary, M. Gautier maintains that he has found them to be common products of the decomposition of our tissues which is a necessary part of life, and that they are found in normal human saliva. If this were true the saliva of a healthy child might be simply one end of scales of virulence of which the others are formed by the slaver of the mad dog or the venom of the cobra. This is, however, not probable, for although human saliva, as contained in many mouths, is very deadly to certain animals, it has been shown that this is due to certain micro-organisms which multiply rapidly in the blood of rabbits and produce death like the germ of chicken cholera, and the virulence of which can be attenuated in the same manner.

The knowledge that the gravest dangers after wounds and surgical operations are due to micro-organisms, which are probably identical with the ordinary bacteria of putrefaction, has led to the careful use of means to destroy the vitality and power for harm of all such organisms which may gain access to wounds. This constitutes what is called antiseptic surgery, and the surgeon now undertakes without hesitation operations which twenty years ago would have been deemed quite unjustifiable, for he knows that by ensuring that neither through the air nor the water, or by the sponges or instruments or fingers, or crevices under the finger nails, there shall be conveyed to the wound one single germ which has not had its powers of growth and reproduction totally destroyed, he need have no fear of blood poisoning. In some of the great hospitals of St. Petersburg, over crowded and unventilated, where you catch the peculiar hospital odor while you are yet in the street, and in which I was told that twenty years ago an amputation of a finger was considered to be a very serious operation, so certain was it to be followed by erysipelas and suppuration, they now perform the most extensive operations antiseptically with excellent results. Not that the bad condition of the hospital does not produce ill effects, but that these effects are of a very different kind from those which used to appear.

About the end of March, 1882, a new form of fever appeared in Aberdeen, Scotland. A characteristic symptom was a swelling of the glands about the angle of the jaw. In a day or two the fever subsided leaving the patient very weak. Usually there was a relapse two days after, and sometimes there were as many as six of these. There were about 300 cases and three proved fatal. It was found that all of them had been using milk from a certain dairy, and that the milk from this dairy contained spores, which when cultivated, produced bacilli. Rats inoculated with these soon died and their tissues were found to be filled with bacilli. Matter taken from one of the sick was found to contain these bacilli, and rats inoculated with this matter died in the same way as the rats infected by the milk. Further investigation showed that the organisms had been added to the milk with water. The observations were made by competent physicians and microscopists and the chain of evidence seems fairly complete. In a communication presented to the Academy of Medicine, Dec. 12, 1882, M. Pasteur states that he has proved that the upper part of the spinal cord of a man or animal dying of hydrophobia is always virulent, and that he has preserved specimens for three weeks which retained their virulence He also claims to have three or four dogs which having once been inoculated with hydrophobia, and recovered, are no longer susceptible. Unfortunately, the great majority of dogs die in the process of rendering them insusceptible. He does not, however, state that he has discovered any micro-organisms peculiar to this disease. With regard to malaria, the latest published researches of importance are those of Professor Ceri. His conclusions are, that it is produced by micro-organisms, the vital properties of which are destroyed by high temperatures and by quinine in the proportion of one to 800 of water. They lose their infectious qualities in the animal organism, but may regain them in the soil under favorable conditions. He considers that it is proved that malaria may be carried by human beings into places hitherto free from malaria, although it is not communicable from one man to another.—(*Philadelphia Medical Times.* Dec. 16, 1882, p. 194.)

According to Lind, the first rains which fall in Guinea are considered the most unhealthy, and they have been known in forty-eight hours to make leather quite mouldy and rotten. Mungo Park observes that three minutes after the rain commenced many of the soldiers were affected with vomiting, and others fell asleep and seemed as if intoxicated.

With regard to diphtheria the evidence is not yet satisfactory, but it seems most probable that it is caused by a micro-organism, which occurs also very commonly in a harmless form and becomes virulent under conditions which are not yet understood. I will refer to but one other form of disease which it is claimed is due to vegetable germs, and that is tuberculosis, better known to you in its most common form—consumption. Dr. Koch has announced that this disease is due to minute motionless bacilli, which can be cultivated outside the human body, but require a high temperature and have a very slow growth. The bacilli are found in the sputa of consumptive patients, and such sputa will produce the disease in animals, nor do they lose their virulence by dying, at least for the period of eight weeks. This tenacity probably depends on the spores, which are formed in the body and not out of it, this being contrary to the habit of bacillus anthracis. Koch produced the disease in animals by inoculation of his culture products; but in the animals chosen for his experiments tubercle is caused sometimes by inoculation of matters which are not tuberculous. This reminds one of an objection made several years ago in the French Academy of Medicine to a report of a somewhat similar series of inoculation experiments. Professor Gubler said they were not conclusive because they had been performed on rabbits, and "the rabbit is a melancholy animal to whom life is a burden and who only asks to leave it." The contagiousness of consumption has long been a disputed point, although the opinion has been growing among medical men that it is sometimes communicated, and statistics contribute a curious bit of evidence in this direction. It is found that of the widows of men dying of consumption the proportion dying of the same disease is larger than it is among widows of men dying of other diseases. Upon the whole, the connection of consumption with a bacillus is still doubtful, though not improbable, and the same may be said with regard to malaria; meaning by this much-abused word the specific cause of intermittent fever.

The bacillus of leprosy was discovered by Dr. Hansen of Norway, in 1874, and has been confirmed by numerous investigations. Dr. White, of Boston, a most competent authority, remarks of this disease, that "its origin is older than history, and it does not appear to have changed for ages. It prevails over large portions of the earth's surface, and we have at present three centres of it in the United States—one in Louisiana, another in the North West, and a third on the Pacific coast, affecting three entirely distinct nationalities, in different climates and under quite diverse methods of life." He believes there is danger of its spread, and that it should be controlled by isolation and by the probibition of the immigration of lepers. The danger is no doubt small—that is to say, there is a very small risk of a very great danger—but it exists, and now is the time to guard against it.

The word germ is used not only to designate independent organisms, which can grow outside the human body, but also particles of living matter which have formed a part of the living body itself, such as at present are believed to constitute the contagion of such diseases as small-pox, measles or scarlet fever, according to what is called the bioplast or graft theory. This use of the word germ is improper and confusing. The graft theory of disease is that a particle of animal matter growing, or capable of growth, (bioplasm) may be transplanted and continue to grow; it will grow normally if it be normal, abnormally if abnormal, and so carry on in the new body the diseased process of which it had formed a part in the old. The results are supposed to be analagous to those observed in cases where from a stock below a graft, fruits and flowers of the kind borne by the scion have appeared, for instance, in the pear grafted on the mountain ash. This analogy did not escape Mr. Darwin, who says, "It is certain that where trees with variegated leaves are grafted or budded on a common stock, the latter sometimes produces buds having variegated leaves, but this may perhaps be looked at as a case inoculated disease."

Because minute organisms are found in the blood and tissues in cases of disease it does not by any means follow that they are the efficient causes of the disease. For example, last July, in Chicago, a boy was seized with tetanus as the result of a wound from the explosion of a toy pistol. Upon examination his blood was found to be swarming with sphæro bacteria. The blood of a horse affected with tetanus was then examined and found to contain similar organisms. Had they stopped there a very pretty theory of the germ origin of tetanus might have been constructed. But they proceeded to examine the blood of the mother and sister of the boy and found that it contained the same forms. Furthermore, after the boy had entirely recovered his blood still was crowded with these bacteria. Wherupon it is suggested that this particular sphæro bacterium, at least, "should be recognized as an altogether pleasant and lovely schizo mycete, dancing away its dizzy life in the vascular channels with a levity born of utter guilelessness. This is called the too-too theory. Nay more, it is claimed that this micrococcus should be regarded in the light of a benefactor. It carried the boy safely through an attack of tetanus and did not desert him when he was convalescent, it sustained his mother nursing with sore anxiety her only son, threw its protecting ægis over another child of the family, and enabled the mother at the same time to attend to the wants of her customers to whom she was in the habit of dispensing a superior quality of lager beer. How can we refuse assent to the proposition that this Chicago bacterium is a good thing to have in the family? In comparison with it how worthless is the prescription of that obliging clergyman, whose sands of life have been running out—lo! these many years."

Some of the relations of meteorological conditions to disease, and especially to epidemics, depend, no doubt, upon the influence which these conditions exert either directly or indirectly upon the growth and development of the lower organisms. As an example of direct influence may be instanced the striking effects of cold upon yellow fever, a single sharp frosty night putting an abrupt end to an epidemic. As specimens of indirect influence we may consider the increase of typhus in cold weather due to over crowding on the part of the poor for the sake of warmth, or the frequent outbreaks of typhoid fever after heavy falls of rain, due to the washing of the infectious particles of typhoid excreta into the sources of water supply. Temperature and light have a powerful influence on the growth of bacteria. Each peculiar organism requires a special temperature which often has very narrow limits. Koch states that the bacillus of tubercle will not propagate at tempertures below 86° F., and therefore it must gain access to the interior of a warm-blooded animal if it is to increase, unless, perhaps, in hot climates.

If we consider the diseases caused by minute animals, we find that the one which has the closest analogies with some of the specific diseases is that which is now known by the name of the parasite which produces it, the *filaria*

Digitized by Google

sanguinis. This parasite, which is found especially in China, India, and some parts of South America, is now supposed to be the cause of that peculiar disease known as elephantiasis, which by older writers was often confounded with true leprosy, and the cycle of its change is a curious one. The mature animal is a worm about the thickness of a hair and from two to three inches long, which lives in the water. When this gains admission to the human body, usually by being swallowed with drinking water, it seems to penetrate to the lymphatic system, and there to produce eggs from which are developed thousands of microscopic filaria, which swim freely about in the lymph and blood. Under ordinary circumstances they are only found in the blood at night, in the daytime they seem to collect in the lungs and lymph channels, but if the patient be kept awake at night and sleeps in the daytime, this habit is reversed and they are then found in the blood in the daytime only. So long as the microscopic filaria remain in the body of man they do not develop into the perfect animal; for this purpose it is necessary that they should find another habitation, and this is furnished by the mosquito. Having been swallowed by the mosquito with the blood, the embryo assumes a sort of chrysalis state, and at the end of three or four days escapes from its host, which is then dead or dying and has usually fallen into water. You will perceive that there seems to be a very nice adaptation between the nocturnal habits of the parasite and that of the mosquito. Dr. Manson, to whom we are indebted for most of our knowledge of this filaria, estimates that it is to be found in about ten per cent. of the inhabitants of Amoy, China, its presence causing elephantiasis and various disorders of the lymphatics. Last year a man affected with this disease, which he had contracted in the West Indies, was for six months a patient in the New York Hospital. If any of the celebrated New Jersey mosquitoes got access to him at night and then returned to die in the scenes of their youth, you can see how a new endemic disease might be developed whose progress would be a terrible puzzle if we knew nothing of the filaria. It is also claimed by some observers that malaria and yellow fever are carried and inoculated by the mosquito, but this is yet to be proved. Keeping in mind the limitations of our present knowledge with regard to the causation of disease by minute organisms, and particulate contagion, let us consider briefly some of those acute diseases of communities and nations which are so commonly known as epidemics.

In the popular sense of this word, "epidemic" means that which is prevalent, affecting a large number of people, but it also implies something unusual and temporary. For example, the most widely spread and fatal disease in the United States is consumption, which in the year 1880 caused over 95,000 deaths, or 124.7 per 1000, yet we do not think of consumption as an epidemic disease. Epidemics are commonly divided into the great epidemics or pestilences and the small, local, common epidemics of familiar diseases, but the two forms shade into each other so that it is very difficult to draw any clear distinction. From the earliest times, in all nations of which we have authentic records, there have, from time to time, appeared forms of disease causing wide-spread desolation and death, when the land seems to rest in the shadow of a destroying angel, who leaves no house in which there is not one dead. There is always a certain element of strangeness about these visitations which seem to depend on no known causes, and to have been beyond the limits of human power to foresee or prevent. Not that all such epidemic diseases are of ancient origin; new forms occur, and old ones disappear for centuries, but in every generation there comes a time when the sickle of the skeleton reaper seems to have a keener edge, and to take on a wider reach.

Such, for example, was the great outbreak of the plague which began in Egypt in the year 542 of our era, and which spread throughout the Roman Empire, being known as the Justinian Pest. At intervals of one and two centuries this disease reappeared, following nearly the old track, until at last, in the fourteenth century, after a long absence it seemed to have gathered strength, and starting from China, overran Asia, Europe and Africa, or the whole of the then known world, destroying in Europe alone 25 000,000 of people and well meriting its common name of the Black Death, or the Great Mortality. Truly, if this Oriental pest, the sparks of which still linger in the Valley of the Euphrates, be caused by minute organisms, this outbreak is one of the most striking examples in existance of the power of the small things of this world to confound the great. It is impossible for us to realize the scenes which were then enacted in Europe in the frenzied terror which was universal. Hecker's vivid description is no doubt familiar to many of you. "Merchants, whose possessions were unbounded, coldly and willingly renounced their earthly goods. They carried their treasures to monasteries and churches and laid them at the foot of the altar; but gold had no charms for the monks, for it brought them death. They shut their gates, yet still it was cast to them over the convent walls." In Avignon the Pope found it necessary to consecrate the Rhone, that bodies might be thrown into the river, as the churchyards would no longer hold them. The grass grew in the market places, the rooks and ravens came into the towns and built in the belfries, and silence was universal." It is incidentally noted that when the plague had passed away "the great increase of lawyers was astonishing to whom the endless disputes regarding inheritances offered a rich harvest. Then came, also, moral and mental outbreaks, the processions of the Flagellants, the fanatical persecuting of the Jews, and a little later the epidemic mania of the dance of St. John in Germany and the Tarantula dance in Italy. But I have no time for even the briefest outline of the exceedingly interesting history of the epidemics of the Middle Ages, and will only refer to one other outbreak, which presents many singularities, namely, the sweating sickness. This disease appeared in England just after the battle of Bosworth field, in 1483, and rapidly spread over the kingdom. It was a violent fever, followed by a profuse and fetid perspiration, the whole crisis being over in a day and a night. It attacked especially strong and robust men, killing them in a few hours.

The whole outbreak lasted about five weeks, and it passed away as suddenly as it came. One attack gave no security against another. The disease again appeared in a mild form in 1506, in a severe form in 1517, and again in 1517 when it spread over Northern Europe. It then entirely disappeared for 23 years, when it broke out again in England with its old malignancy, four and twenty hours being decisive of the event. Since the autumn of 1551 the sweating sickness has but once appeared in its rapid and malignant form, and then it was in a very limited area. This was in Roettingen, a small town of Franconia, in the fall of 1802. The visitation was quite characteristic, but it lasted only ten days and ceased with the advent of clear, frosty weather. It is exceedingly doubtful whether the various fevers accompanied by profuse perspiration, which many physicians seek to identify with this disease, such as the Picardy sweat or miliary fever, which first appeared in 1718 and has since that time been frequently observed in France and Northern Italy, have really had any relation to the English disease. One of the peculiarities of the sweating sickness was that it began in Western Europe and spread eastward, whereas almost all the great plagues came from the East—from Egypt and far Cathay—for which there was supposed to be some mysterious reason connected with the birthplace of the human race. When, however, we remember that until within a very recent period the civilized world, which alone preserves intelligible records, was confined to the West of Europe, so that epidemics of external origin must almost necessarily have come from the East, and, moreover, that in that East was a swarming population, poor, overcrowded, filthy, and specially liable to famine, which is the great forerunner of pestilence, there seems nothing remarkable in the course taken by epidemics, which, as a rule, follow the lines of travel. This portability of the cause of epidemics, its "portagiousness," as Dr. Gibbs proposed to call it, is a very striking feature of many of the spreading diseases, and is a strong argument in favor of the proposition that this cause must be something which is material and which is not a gas. It is, in fact, extremely difficult to explain the well authenticated instances which we have of the introduction of yellow fever into a place by means of infected bedding or clothing and its steady spread thereafter, in some instances keeping on one side of the street and passing from house to house with the regularity of a postman, at the rate of about 40 feet a day, unless we assume that this poison is not only material and solid; but living; that it may grow and increase outside the body. The old farmer's remark that "Yellow Jack can't go anywhere unless you tote him" is quite true for distances of a few miles, but for a few squares only he seems to be able to get along without assistance.

The sudden development and cessation of some epidmics, such as the sweating sickness, are sometimes urged as being opposed to the idea that living organisms can be the cause of such phenomena, but we have some well observed facts in relation to the sudden development in large numbers of rare and remarkable fungi, or of certain insects, such as the potatoe bug, the grasshopper, or the phyloxera of the French vineyards, to prove that this is not an unprecedented thing. It is, however, by no means true that all epidemics can be supposed to spread in this manner. Take, for instance, influenza, of which more than ninety epidemics have occurred since its first accurately recorded appearance in 1510. Usually the epidemic wave of this disease travels with great rapidity from the north and east towards the west and south, affecting the great majority of the population in its path. It does not follow the lines of travel; when it reaches a place it strikes the whole at once, and there is nothing about it which would indicate that it is in any way dependent upon germs; on the contrary it would seem that its cause must be either gaseous or some form or variation of force.

Cerebro spinal meningitis, which is one of the new epidemic diseases of this century, also approaches influenza in its pandemic character and in the difficulty of explaining its phenomena by any form of the germ theory.

Twice it has broken out simultaneously in this country and in Europe, it is certainly not contagious, and we are almost totally ignorant of the conditions under which it appears, spreads, or disappears. The only theory which will fit influenza and cerebro-spinal fever is the famous one of epidemicity, or the epidemic constitution, which as given by most writers, has a painful resemblance to the explanation given by the bachelor in *Le Malade Imaginaire*, who, when asked how opium produces sleep, replied that it is by a certain sleep-making faculty which it possesses.

An improvement on the epidemic constitution is the theory of Dr. Robert Lawson, who supposes that in connection with periodical variations in the magnetism of the earth there are formed on the Southern hemisphere what he calls pandemic waves, which pass from South to North occupying four or five years in travelling from the Cape of Good Hope to the Irish Coast. The passage of this wave gives rise to malarial fevers in India, the pest in Asia, yellow fever on the tropical Atlantic Coasts, typhus in Germany, typhoid in France, and relapsing fever in Ireland. This idea is varied and improved upon by Mr. Cushing, who, in a paper published in the *International Review* in 1880, supposes that famines and epidemics depend on changes in the sun, indicated by the so-called sun spots which have a cycle of a little over eleven years. It is probable that there is some truth in this idea, which is quite compatible with the germ theory, but the table which he gives to show the coincidences of maximum sun spots and epidemics is something like one of Mr. Vennor's almanacs, it being usually possible to find some kind of an epidemic at some point of the earth's surface within any period of two years. The resemblance to Canadian meteorological prophecies is also seen in the fact that Mr. Cushing predicted epidemics in 1882 to accompany the maximum sun spot period of that year, and that the said epidemics failed to appear. The great objection to all theories of this kind is that they lead the persons who uphold them to overlook or deny the existence of causes much more comprehensible and which can be practically dealt with. First of all there is the influence of contagion which is almost always denied by these theorists. Then there is the influence of the seasons, of uncleanliness, of famine, of poverty and misery in a thousand ways. It is true that none of these will explain the phenomena of some epidemics, why it is that cholera or yellow fever will sometimes spread like fire in the dry grass, and again are stamped out with ease, why scarlet fever is the English pest, and typhoid that of Paris, or why small-pox should at times show a special virulence; but at all events we gain nothing by giving up the problem as insolvable or referring it to an epidemic constitution or a pandemic wave.

Each epidemic is a problem by itself, and when carefully studied it is usually possible to determine some of its causes at least, if not all of them. The recent discoveries in the life history of some of the micro-organisms to which I have called your attention, the fact that variations in nutriment, temperature, air supply, and stage of growth at which propagation takes place may convert one of the most harmless of microphytes into one of the most deadly, seem to give us a clue to the explanation of many phenomena in epidemiology heretofore deemed most mysterious.

Digitized by Google

We must also bear in mind the powers of natural selection not only as it affects the germ but the recipient of that germ if we are to understand the periodicity of these affections.

Even in the midst of the most terrible epidemics there are always some who resist its influence, and when it has passed away these are the survivors who transmit some of this power of resistance, with other peculiarities, to their descendants. Where one attack of the disease confers, in case of survival, protection against a second attack, it is easy to see why there should be long intervals of absence of such diseases from a community, but the same follows in a less degree by the laws of natural selection and heredity, even when the disease is one which may recur.

Small-pox still causes great alarm when it appears amongst us, but we can hardly realize the feelings with which it was viewed in the last century throughout Europe. There were published last year some extracts from a register kept from 1728 to 1764 in Kilmarnock, Scotland, a town at that time of between four and five thousand inhabitants.

From this it appears that small pox came round regularly about once in five years. Each epidemic affected all or nearly all who were not disease proof, and therefore its victims were almost entirely children under five years of age, who had come into existence since its last visit.

Those who recovered were disfigured for life. There were in fact, says Dr. McVail, three Kilmarnocks. One had no fear of small-pox for its people had already met it. Some were blind, some were deaf, most were scarred and disfigured. The second Kilmarnock was under the green sod of the church-yard. The third Kilmarnock consisted of a band of about five hundred little children, which had yet to face the most terrible enemy it would ever meet. "One can barely imagine what must have been the feelings of a mother during these visitations. Even when the town was free from pestilence there would be the constant foreboding of its all too certain coming, and when at last the first case occurred, when the doctor was called in and pronounced the disease to be small pox, his words would be heard as a sentence of death to some member of almost every family containing little ones." One of the peculiarities of the great epidemics is that they are often preceded by an unusual prevalence of diseases having somewhat similar symptoms, although quite distinct from the true pestilential affection; thus bowel affections precede cholera, malarial diseases yellow fever, and typhus the true plague; and it is for this reason sometimes extremely difficult to discover the first cases of the epidemic, and to fix the precise date of its commencement.

It is important to remember also that the mere introduction of germs into the living organism does not ensure their multiplication, or the production of disease. The condition of the organism itself has much influence on the result. Some persons cannot be vaccinated successfully, many persons can be vaccinated successfully at one time and not at another, some persons do not contract diphtheria or scarletina or yellow or malarial fevers although fully exposed to their causes. Pasteur has certainly made a hasty generalization in declaring that the only condition which determines an epidemic is the greater or less abundance of germs.

I hope that as I have indicated a few of the many points upon which our knowledge with regard to these disease germs is still imperfect, it has occurred to you that some of these could be settled by experiment; and that you have felt a certain degree of impatience on learning that these experiments have not yet been made, and that we must still suspend judgment.

I hope also that you may appreciate the importance of having these researches made, that they should be made for the benefit of the world, and when I tell you that the governments of England, France and Germany are employing the best talent they can get and furnishing money for this purpose, while your own country has stopped a series of most promising investigations of this kind, which were being carried on by some of our most competent scientific men, and has deliberately resolved to confine national public health work to paying bills of quarantine inspectors *after* the epidemic has made its appearance. I think you will feel a certain sense of — well, never mind, what it is a sense of—but I think you will feel it all the same I find however, that I am on the verge of making some "practical" remarks, which I wish carefully to avoid.

At all events we have learned enough to know that the life which is born of, and nourished in, death and corruption may become the cause of disease and death in higher organisms, and that, too, to an extent in comparison with which the ravages of war sink into insignificance.

The possibilities which exist in one of these tiny crystal rods or spheres we have as yet only begun to comprehend, but as we come to understand them, the wonder seems to be, not that so many die, but that so many of us are left alive.

Yet, if we turn from limited localities and consider the life of the great races of the earth, we find that everywhere the gain is greater than the loss, though nowhere is it so great as in our own country.

If we suppose that each of the little crimson disks which keep up a ceaseless waltz through the blood vessels of the growing boy has individual consciousness, we can imagine that their views of their environment and its probable future might be by no means clear. They see new corpuscles entering the dance every moment—from whence they know not—and, in a little time, they are disintegrating and passing away. It seems like an enormous waste of generative and formative force, but by and through this apparent waste the boy becomes a man. In his turn he plays his little part in the development of the race and goes over to the majority.

In the words of the Rubayat—

> "'Tis but a tent where takes his one day's rest
> A Sultan to the realm of Death addrest;
> The Sultan rises, and the dark Ferrash
> Strikes and prepares it for another guest.
>
> "And fear not lest Existence closing your
> Account and mine, should know the like no more.
> The Eternal Sâki from that Bowl has poured
> Millions of Bubbles like us, and will pour."

A WORSE THAN USELESS TRAP.

The accompanying drawing shows what was found in an up-town house in this city, by a plumber who was called in to mend some leaky pipes. The pipe from the basin is supposed to extend down into the "round" or "bottle" trap, as is indicated by the dotted lines. The overflow pipe entered the trap above the water line, at the same level as the outlet, as shown, and the plumber who discovered the case and reported it to us stated there was a draft out of the overflow strong enough to blow out a

candle. When our representative went to verify the matter he found the overflow closed by paper carefully pasted over it on the inside of the basin. This had been done by the occupants to keep out the smell, which was reported to be very bad.

Correspondence.

TILE DRAINS.

COLORADO SPRINGS, *March* 12, 1883.

To the Editor of THE SANITARY ENGINEER:

In laying some tile recently we came in contact with several small springs in line of the trench, which tile empties into the bed of a rapid mountain stream. There are springs walled in on both sides of the stream above within 200 yards of where the tile was laid.

Some days after the work was done water began running from the inside. There has been no connection with any fixtures. The tile was good vitrified drain tile laid in cement, each joint carefully made.

Perhaps it would be well to state that the above is to convey the waste from a bath house containing nineteen tubs, two closets, one swimming bath and a few bowls. Question, is it not *probable* that some of the tile is not thoroughly glazed and allows sepage? Also, please state if you consider it detrimental or objectionable to leave it as it is. Water turned in from the upper end of waste passes off promptly and *perfectly* free.

A reply through your columns would greatly oblige,

A READER.

[We should not consider the probability of the water soaking through imperfect glazing so great as that of its coming through imperfectly closed *joints*. Few masons who put pipe together are aware how difficult a thing it is to ensure the tightness of all the joints. Whenever a test is applied the number of leaks developed is astonishing.

If imperfections in the glazing exist to a sufficient extent to account for the flow above reported, they will be likely to be silted up and stop the flow after a few months. We should advise having your pipe tested by applying a tight rubber plug at the lower end and filling it with water. If any bad joints exist they can be found readily in this way. Of course, there should not be much earth filled over the pipe where such a test is made. Leaks often occur by breaking down the pipe, and splitting the bells or hubs open with the load of the trench filling, for lack of good continuous bearings. The pipe should be bedded in cement the whole length of every piece, to ensure good support.

The objections to using a leaky pipe for drainage are these, viz.: Whenever a dry time occurs the sewage will flow out through the leaks and pollute the soil. The importance of such pollution is entirely a local question. Moreover, the escape of the more fluid parts of the sewage through leaks would, perhaps, lead to trouble for lack of flushing the inside of the drain pipe and allow it to accumulate solid matter.]

SIZE OF BASIN WASTES.

To the Editor of THE SANITARY ENGINEER:

What do you consider the proper size for wash hand basin waste pipes? Is it well to have so great a difference as is common between the outlet of the basin and the trap? Would not the latter be more thoroughly flushed and kept cleaner if the hole in the bottom of the basin and the coupling connecting it with the waste pipe were of the same size as the latter? Do you approve of bars or strainers over the outlet of basins and baths, and of the ordinary plug attached to a chain? Is there any way of doing away with the latter without using a patented device?

Yours respectfully, PLUMBING STUDENT.

[The outlets of basin plugs could with advantage be larger. It is necessary to have the strainer to keep articles from dropping in and choking up the trap. The ordinary Boston Waste Cock is not patented, though the fact of a device being patented should be no objection to its use. You will find this subject fully discussed by "Sanitas," in his articles on pages 36, 71, 92, of Vol. IV.]

A PLUMBING SPECIFICATION ONLY IN NAME.

MACON, GA., *March* 9, 1883.

To the Editor of THE SANITARY ENGINEER:

I enclose you a plumbing specification showing what was thought proper and fit for a large educational institution. I desire your candid judgement thereon.

Yours truly, B.

Plumbing.—Furnish and set up in each bath-room on the second and third floors two tin planished copper bath tubs to be 5 ft. 6 in. long; also one in the president's residence, and one in the professor's department.

Water closets.—Furnish and set up as shown on plans, one in the president's residence, two in basement two in professor's departments, four on the second and third floors each, Harrison's turn pan closets with porcelain bottoms and brass fittings. Put on brass fittings to bath-tubs.

Wash basins.—Finish and put into each bath-room one marble top wash-bowl, counter-sink slab and base. Supply all tubs through ¾" iron pipe, also all the wash bowls, sinks and water closets, and waste through inch pipes. Properly trap each outlet separately with full S trap. Supply all bath-tubs and sinks with hot and cold water. * * All the waste from bath-tubs and bowls will discharge into the cast iron sewer pipes which are carried down and discharged into the sewers. * * *

Sewerage.—Furnish and lay down sewer pipes of such material, terra-cotta or cement, as will do the best work, of such sizes and such directions as will be fully shown on

Digitized by Google

the foundation or sewer plans, all joints to be thoroughly cemented together.

[We do not consider it a specification even in name. It if simply a suggestion to the contractor that the committee expect certain appliances to be located in different parts of the building, leaving it for him to decide what he will put in and how he will do work. If they do not get a wretchedly poor and dangerous job done, previous experience under like circumstances will count for nothing. To offer such a memoranda as a plumbing specification in the light of present knowledge on the subject is disgraceful.]

HEATING WATER FOR LARGE INSTITUTION.

To the Editor of THE SANITARY ENGINEER:

In a public institution using a large quantity of hot water it is proposed to have a hot tank in the garret, and to use for heating the water in this tank the steam boiler which heats the building with steam in the winter, a coil being placed in the tank. In summer it is proposed to heat the tank by a small auxiliary furnace in the garret. Will you please give some directions about the arrangements common in such cases? Also whether, as fixtures will be connected with a pipe descending from this tank, it will not be impossible to obtain hot water until the cold water which gathers in the pipe by its cooling has been drawn out, for I suppose you cannot get a circulation in a case like this.

On this account I have recommended to the parties that they had better heat their water in a closed tank in the basement, letting it rise to the reservoir in the top, and

then return to the closed tank, thus always having a circulation. B.

[The annexed sketch shows how we would do this thing, especially in a high building.

The water may be pumped to the cold tank, or should the water works' pressure be great enough, it may be regulated by a ball cock. From thence it will run to the hot tank and will level up again to the same height in the distributing and circulating pipes *a* and *b*. The small pipe over the top of cold tank is an air vent. With this arrangement the water will be always warm at the faucet.

The coil within the lower and closed tank may be one inch pipe for live steam or large pipe for exhaust steam; brass pipe is generally used.

With the hot tank in the top of the house the water will not circulate and be warm; the result will be as you state.

You also say it is proposed to take steam from the heating pipes to warm this tank. There are heating systems you might tap this way and not spoil the circulation, but on general principles it is wrong.]

WARMING CHURCHES.

NEW YORK, *March* 7, 1883.

To the Editor of THE SANITARY ENGINEER:

Should your correspondent in March 1 issue wish further information respecting the system of warming churches by direct radiation by placing pipes in each pew, he need not go so far as Detroit, he will find it much nearer home; Christ's Church, Rye, Christ's Church, Greenwich, Conn., Methodist Church, Mamaroneck, St. James' Church, New Brunswick, N. J., and others in various parts of the country. The system having been in use some fifteen years.

Resepctfully yours,

BAKER, SMITH & CO.

MAN-HOLES FOR UNTRAPPED HOUSE DRAINS.

To the Editor of THE SANITARY ENGINEER:

I inclose a suggestion which I do not remember to have seen, intended to obtain the advantages derived from a trapless main drain, and obviate some of the disadvantages. The great objection is the ventilating of the sewer through the house pipe, and the only method of using the trapless drain which I have observed is to make a continuous pipe from the sewer up to the top of the house, Now I propose to interrupt the drain by a man-hole and to give it foot ventilation as though it were trapped. This man-hole should be built carefully for its specific purpose and have the bottom truly rounded, and as smooth an interior surface as possible obtained by a coating of cement. Just at the lowest part of the man-hole bottom should be turned up a sewer connection made just flush with or a trifle below the general contour of the bottom. The soil pipe is brought into this man-hole, terminating with an eighth or quarter bend directly over the sewer outlet, the man-hole, of course, covered with a perforated cover. Now, I claim less obstruction than if a trap were used, and little liabilty of odors from the sewer, the latter for two reasons, one that Dr. Rozsahegyi found the prevailing air currents to be from the house to the sewer, rather than from the sewer to the house. The other, and more important one, that the soil pipe extending above the roof will exert the same influence on this man-hole as on the ordinary foot ventilation pipe, inducing a current into the man-hole, and up the soil pipe. The sewer air which then enters the soil pipe will be very largely diluted with pure air instead of being in its normal condition, as is the case when the soil pipes go directly to the sewer.

The man-hole should be either under the outer edge of the sidewalk, the plate being set in one of the flags, or just outside the curbing. As to the expense of constructing it, if it be built when the trench is dug to make the connection between the sewer and the house, it should cost not much, if any more, than the man-hole in which the trap is often placed. D.

[The objection to the plan here proposed is that at certain times there would likely be offensive odors from the sewer coming up through the man-hole cover, which, in this instance, is too near the house, and it is hardly safe to rely on the soil-pipe to act as a constant ventilator in such a situation. Rozsahegyi found the prevailing currents away from the house, but his experiments were made at one season of the year; Dr. Soyka, at a different time, found opposite conditions. Indeed, the direction of the air currents, it seems, is controlled by temperature in the absence of the flow of liquids, and it is not safe to assume one direction at all times or under all conditions.]

CONNECTING A SINGLE BOILER WITH TWO RANGES.

LYNN, *March* 9, 1883.

To the Editor of THE SANITARY ENGINEER:

I have connected a 30-gallon copper boiler to two ranges with ¾-inch brass pipes, similar to cut in your issue of December 8, 1881. When the upper range is used alone everything works all right, but when both ranges are in use there is a continual noisy clicking as in steam pipes. I do not wish to make any change if there is no danger, and if you can tell me the cause and remedy you will greatly oblige AN OLD SUBSCIBER.

[The connections have probably been made as indicated by the full lines in the drawing of the issue of Dec. 8, 1881. The noise may be the result of one of two causes. First, the sum of the heating surface of the two water-backs may be sufficient to get the temperature of the water to 212° or above at the side coupling where it enters the boiler, the result being noise, due to the "water hammer" caused by the rapid and intermittent condensation of steam at or just beyond the side coupling. Second, a great difference of temperature between the waters from the two backs. If the water from the upper range back makes steam, and the under one does not and is much colder, the "water hammer" will take place in the side connection at the branch and beyond it.

When the cold water is taken from the street main, so long as the noise remains there is no danger of over-pressure in the boiler, but should it cease while the fires are very strong and no water is drawn, steam might form in the upper end of the boiler, with the usual consequence of driving the water out, etc. This can only happen when the water-backs have too much heating surface. The tank supply with relief pipe, however, obviates this risk.

We prefer a separate side and bottom coupling for each water-back in such cases.]

LEAD JOINTS ON CAST IRON PIPE.

We recently quoted some extracts from the *Journal of the Society of Arts* of a paper by B. H. Thwaite, on the corrosion of iron pipe in proximity to lead joints. This has called out the following replies:

Mr. W. P. Buchan, of 21 Renfrew Street, Glasgow: "Upon reading Mr. B. H. Thwaite's remarks under the above heading, it occurred to me that in his reference to iron railings fastened with lead, which has corroded away near the fastening, he has not drawn any distinction between malleable-iron and cast-iron railings, as to their respective liabillty to said corrosion. I think the cast-iron railings are not so liable to be acted upon as the malleable, and, consequently, the lead-jointed cast-iron pipes will stand better than Mr. Thwaite imagines. So far as the action of general ordinary house sewage upon the interior of cast-iron pipes is concerned, I have seen such, after having been in use many years, quite clear. While, supposing an iron pipe gets choked up, it is often not from rusting of the iron any more than a lead or stone-ware pipe being choked in same circumstances. If the contact of lead with cast-iron pipes were to have the effect of causing the iron to get soon rusted away near the joint, many iron pipes would not have lasted as they have done,"

Mr. W. Bryan, M. Inst. C. E.: "Town sewage does not appear to affect iron pipes with lead joints as much as ordinary water. A short time ago, I examined a number of iron pipes, twenty-four inches in diameter, forming the main outfall from Blackburn to the irrigation farms, and found them perfectly free from rust or corrosive action. These pipes have been laid about a dozen years. I have examined many iron pipes used for sewage, and in every case with the above result. The greasy matters appear to form a coating on the inside of the pipes and thus to protect them. I have also examined water-pipes with lead joints forty years old, and have found them in perfect condition: and others, through which very soft moorland water, having an average hardness of only two and a half degrees, had been supplied, completely filled with rust after thirty years' use. Lead joints are far superior to any others, and no one need fear the action Mr. B. H. Thwaite is apprehensive of."

NEW PLUMBING INSPECTION DISTRICTS.

Two new men, H. D. Dickinson and Alexander Higinbothem, both plumbers, have been added to the corps of plumbing inspectors employed by the Health Department of this city, and the ground redistricted and assigned as follows: Below 23d street, Eagleson; between 23d and 100th streets, west of Fifth ave., Dickinson; between 23d and 59th streets, east of Fifth ave., Golden; between 59th and 105th streets, east of Fifth ave., Hollick; between 105th and 122d streets, east of Fifth ave., Hooper; above 122d street, east of Fifth ave., Higinbothem; and above 100th street, west of Fifth ave., Elliot. Inspector Golden, in addition to the regular work of his own district, reports at the department every morning for special service anywhere in the city, in cases which need immediate attention.

The following violations, most of them trivial and none of a very serious nature, were reported last week: By Eagleson one, Dickinson three, Golden two, Hollick seven, Hooper six, Higinbothem six and Elliot three.

No violations of light and ventilation plans were reported and no cases referred to the attorney.

AN ALDERMAN ON WELLS.

Last week the aldermen of Brooklyn were discussing the propriety of closing all the wells in the city condemned by the Health Commissioner. Those members who spoke generally appreciated the importance of the subject, but there was one exception, whose views were sufficiently original to deserve republication. Ald. Schmitt "hoped the motion to close the wells would not be adopted. He knew something about the analyzing of water. The water in his ward (the sixteenth) was analyzed when it was not clear, because of the chips and other things in it. Repairs had just been made to the pumps. The water was now clear. I can't say anything about the fourth ward; whether the water is unfit for consumption or not. I am speaking of the sixteenth ward, I think if the gentleman has been there, he has been drinking fresh lager beer and knows little about the water. Let them pump *the old stagnant water out of the wells and they will be fit for use.* There may be a water crisis, and then we will want the pumps."

HEATING AND VENTILATING A HOSPITAL.

CHICAGO, *Feb.* 15, 1883.

To the Editor of THE SANITARY ENGINEER:

The last number of your paper contained a very interesting article of Dr. Billings on Hospitals. The cut therewith connected, showing a novel plan of an English hospital-ward, reminds me so much of a plan by me six years ago presented to the Cook County Board that I venture submitting the same to you for publication. It does not merely comprise a single ward, but a complete hospital subject to extension as the case may demand. The wards are all isolated, generally two stories, occasionally one story high, all with basement, as demanded by health as well as convenience. The central part is taken up by a room about 18 feet in diameter, containing conveniences,

etc., and four special grates for exclusive heating and partly for ventilating. The main ventilation is effected through the central shaft *V V*, having iron smoke flues in centre. The triangular (shaded dark) shafts, open near the ceiling, carrying the foul air down to the floor of basement, thence into shaft *V*. This ventilation not operating to perfection when the grates are not fired, a special furnace must be connected with the base of shaft *V*, to be used whenever required. Wards for contagious diseases should have a special sort of furnace, to be constantly used in order to destroy the germs. The grates are arranged with metal flues which warm the incoming fresh air (when required to be warmed), and discharge the same into the room through a register located some 9 or 10 feet above the floor. No ventilation should be required through windows; double sash being wanted for the winter season. *Any ward proving to be contaminated should be torn down*

at once and wholly rebuilt with new or disinfected material. I believe that a hospital of some such description would meet a very urgent sanitary demand. To believe, however, that any city or county in this country would ever erect a hospital of this character would be simply nonsense, since it involves no special benefit to the surrounding "property of influencial individuals." What is wanted is a costly and showy complex of buildings with as much reference to use as is therewith practicable. The case is wholly left to individuals of means and humanitarian dispositions.

THE BOARD OF TRADE ON ELECTRIC LIGHTING.

The English Board of Trade has recently issued for consideration certain "model clauses" which are proposed to be inserted in provisional orders and licenses granted by the Board under the Electric Lighting Act.

The following is the clause on "Regulations as to Safety."

"Mains and service lines shall be of a pattern to be approved of by the Board of Trade, and shall be covered with thoroughly waterproof covering, and be contained in pipes or cases of sufficient strength to protect them from injury, and due precaution shall be taken to prevent any insulating material which may be used being rendered plastic or being otherwise injured by the action of external heat. The insulation to be of a durable character, with a resistance of not less than 1,000 ohms per mile run, or such other amount as may from time to time be described by any regulations of the Board of Trade. No conductor in any part of any circuit shall be connected with earth unless such connection is sanctioned by the Board of Trade. The current through any service line shall not exceed —— amperes per square inch of section of a pure copper wire of equal conductivity. The supply of electricity to each house shall be capable of being turned off at some point outside the building. In each conductor of each service line shall be inserted a safety fuse or other safety connection of a pattern to be approved by the Board of Trade. Such fuse or connection shall be situated in a distributing box or at some other point in the service line which is easily accessible, and shall be of such a nature as to cut off the supply when the current through such conductor exceeds by more than 100 per cent. (or of such other smaller proportion as the undertakers may think fit) the maximum current which such service line is intended to supply. The positive and negative poles upon the premises of the consumer shall be at a distance of not less than 3 in., and the terminals shall be of a construction and pattern to be approved of by the Board of Trade, and no portion of any service line which may be upon the premises of any consumer shall contain any joint between the point at which it enters upon the said premises and the said poles. Where the maximum current given to any consumer upon the parallel system exceeds fifty amperes, the supply shall be divided and given at more than one pair of poles, so that the maximum current at each pair of poles shall not exceed fifty amperes, except in such cases and under such conditions as may be approved of by the Board of Trade. Where the difference of potential between any point of any main or electric line used by the undertakers and the earth, or between such point and any other point upon the same circuit exceeds 200 volts, such precaution shall be taken by the undertakers as may from time to time be prescribed by the Board of Trade to prevent such main or electric line becoming electrically connected with or leaking into any main or electric line through which electricity passes at a different potential. Where the difference of potential between any point of any charging main and the earth or between such point and any other point upon the same circuit exceeds two hundred volts, all distributing mains connected therewith shall be fitted with such appliances and apparatus of such pattern and construction as may be from time to time prescribed or approved of by the Board of Trade, for the purpose of ensuring that such mains shall be effectively disconnected and kept disconnected from such batteries during the hours of charging. No portion of any electric line which may be placed by the undertakers above ground, and which is not enclosed within any distributing box or building, shall be at a potential differing from that of the earth by more than two hundred volts. Where any portions of any electric lines belonging to the undertakers are exposed in such a position as to be liable to be struck by lightning, they shall be efficiently protected by lightning dischargers of such pattern and construction as may be from time to time prescribed or approved by the Board of Trade. The difference of potential at corresponding points of the positive and negative conductors used as distributing mains or service lines shall not at any time exceed two hundred volts, and no portion of any such conductor shall be at a potential differing from that of the earth by more than such quantity. The difference of potential at any two points of a charging main shall not exceed four thousand volts, and no portion of any such main shall be at a potential differing from that of the earth by more than such quantity.

Provided always, that if the undertakers at any time desire to supply electricity by agreement at a high tension for the purpose of arc lighting or for any other purpose, the Board of Trade, if they think fit, may relieve the undertakers from all or any of the obligations by this section imposed upon them, and may substitute such other regulations to be observed by the undertakers in relation to such supply as they may think expedient; and all regulations so substituted shall be observed by the undertakers, and shall, for all purposes of enforcement or otherwise, be deemed to have been inserted in this section in lieu of the regulations for which the same are substituted.

ELECTRIC LIGHT NOTES.

The Theatre Royal at Edinburgh will be lighted throughout with electric lamps.

The Edison Electric Illuminating Company, of Brockton, Mass., has organized with a capital of $100,000.

Reading, Pa., has awarded a contract to put forty electric lights in the principal streets to the Reading Electric Light Company.

Swan's incandescent lamps have been applied to lighting the General Infirmary at Vienna. Two wards, operating room and medical instruction room are now illuminated by them. In the wards a portable lamp is used, as well as fixed lights, for cases where lights need to be brought near patients.

A resolution was introduced into the Board of Aldermen, the 20th inst., authorizing the New York and Brooklyn Electric Light Company of New York to lay suitable wires, necessary poles, pipes or other fixtures in, or over and under the streets of the city of New York.

A jury in the Supreme Court decided, the 21st inst., that poles erected by the Metropolitan Telegraph and Telephone Company in certain streets of this city are nuisances. The jury found that the poles were larger than necessary, and incommoded the public in its use of the street. On this verdict, says the *Times*, a motion was heard by Judge Barrett, on Monday, for a decree directing the defendant corporation to remove the objectionable poles, and restraining it from replacing them with similar obstructions.

The cost of electric light in workshops was discussed recently by the Institution of Engineers and Ship-builders in Scotland. A. C. Kirk, of R Napier & Sons, stated that for twelve Brush arc lamps burning three hours per day, the cost of each lamp was 5*s.* 7*d.* per week; 1*s.* 6*d.* was allowed for cost of maintenance, and half a man's wages, 15*s.* per week, for attendance; cost of carbons 8*s.* 6*d.*, allowing for depreciation of the Brush machine, the total cost was £2, 1*s.* 9*d.* ($10.10), or 3*s.* 7*d.* per lamp (84 cents). If the lamps burned 49 hours per week, the cost was 6*s.* per lamp per week ($1.40). Mr. Dick, of the Newton Steel Works, which had 14 or 15 Brush lamps, reckoned the net saving for six months at £19 1*s.* 6*d.* ($93), and he thought the use of the electric lamps had increased the amount of work turned out.

Meter-ites.

An agent has arrived in this country with two of the Grimstow regenerative gas burners, 10 and 25 feet capacity respectively, and is making an effort to bring them to the notice of American engineers. This burner was described in our issue for September 28, 1882.

The Philadelphia Board of Health has received a complaint that a nuisance is created by pumping the refuse from the gas mains out on to the street.

The Judiciary Committee of the Senate of New York have reported favorably an amendment to the law of June 16, 1879, giving to gas light companies the privelege of

Digitized by Google

using electricity. The *Tribune* states that the gas companies disclaimed to one of its reporters any interest in the measure. The Treasurer of the New York Gas Light Company thought the bill had been introduced in the interest of the gas companies in the smaller places where apprehension is felt about the rivalry of the electric light.

Electrician states that up to the beginning of February 19,536 Edison lamps were in use in Europe; up to December 20, 1882, 29,192 were in use in the United States.

Food and Drugs.

ONE MILK FARM NEAR NEW YORK.

To the Editor of THE SANITARY ENGINEER:

The present stir about the milk supply of New York City reminds me of a sketch of the surroundings of a small milk farm in Morrisania made while strolling in that region some months ago. The sketch is, as near as I could make it, a literal reproduction of the filthy scene. The pump at the centre of the sketch was depended on for the drinking water, and for washing the pans. Not ten feet from this

pump was a sodden slough, *A*, of animal refuse of all kinds, *B* and *C* were manure piles from 30 to 50 feet distance at a rough estimate, while the ground around the pump was liberally sprinkled with manure. From questions I asked and replies given, it was apparent that no suspicion of pollution of the water had crossed the minds of the persons who ran this milk farm, though it was impossible that every rain should not wash the contents of the slough right into the well. B.

A bill was reported from committee in the Massachusetts Legislature, March 14, against the adulteration of milk, butter, cheese and other articles. It provides for the appointment of an inspector by every municipality with over 2,000 inhabitants.

A correspondent states in the London *Lancet*, that an agitation is on foot in Germany having for its object the suppression or limitation of the use of analine dyes in the manufacture of articles of clothing. These dyes have been found to be highly prejudicial and even dangerous in some recent remarkable instances, and a strong feeling in opposition to their use has been set up in certain quarters, which is likely to take the form of Parliamentary action.

THE AMERICAN GROCER.

The following will appear in the *American Grocer* of this week.

OFF FOR HOME.

After thirteen years of faithful service with the *American Grocer*, the last seven years of which were passed as its editor and publisher, Mr. W. T. Jones voluntarily resigns his position to make his home in England. He goes possessed of fame and fortune, the well-merited reward of his push, pluck, energy and thorough knowledge of how to make a successful newspaper. He made of an unprofitable journal, of narrow influence, the representative newspaper of its class, and obtained for it an international reputation. He took it when its income barely met its expenses, and leaves its one of the most valuable newspaper properties in the United States. His success is due to his quick perception of what was for the "best interests of the retail merchants," and the quickness and certainty with which his plans were executed. No amount of criticism, abuse, or ridicule had the slightest influence in changing his purpose to do what he believed to be for the best interests of the *American Grocer*. It was the persistent energy and economy of the man when he was foreman of the composing-room that won the admiration of the stockholders and caused them to place the paper in his charge. The savings from his modest salary as printer enabled him to make small investments in the stock of the *American Grocer* Publishing Association, and as the revenues of the paper grew his holdings of its stock increased to such an extent that he is now able to retire with an ample competency. As an editor, Mr. Jones excelled. His judgment as to the drift of opinion in trade matters was unerring. He divined the wants of his subscribers and met them. We know that the good wishes of advertisers and subscribers, together with those of the stock-holders and his associates in the management of the paper, will follow him to his old home, with the hope that he may there enjoy length of days, blessed with health, happiness and continued prosperity.

Mr. Charles Granville, for the past twelve years associate editor, also resigns his position, in order to return to England. It is with deep regret that the *American Grocer* parts with one so closely identified with its history, and who has done so much to make its pages bright, spicy, instructive and entertaining. Possessed of qualifications of a high order, he worked steadily and with enthusiasm to keep the *American Grocer* at the head. His long and honorable service upon the paper brought him more in personal contact with its readers than any other member of the editorial staff. We but re-echo the sentiment of thousands of merchants all over the country, and of his friends in this city, in wishing him a safe voyage, joy in reunion with long separated parents and friends, with added years of health in which to employ his gifted powers for the good of others, and finding therein an ample reward for himself.

Mr. Frank N. Barrett, for the past seven years the commercial editor, assumes the responsibilities and duties of Editor in Chief. He assumes the more honorable position with a determination to use his own powers, and those of the best available talent, to make the *American Grocer* a paper that is a necessity to those identified with the constituency it serves, and the best of its kind in the world. His power to do that will best be made manifest in future issues of this paper, and the quicker accomplished if he is accorded the same measure of good will and assistance that has been so generously bestowed upon his predecessor.

Mr. E. N. Root, for many years actively connected with the business interests of the paper, becomes publisher. Prior to his connection with the *American Grocer* he was for eleven years associated with the publisher of one of our leading weeklies, and his eighteen years of experience peculiarly adapts him for his new and more responsible position.

It affords us pleasure to acknowledge our indebtedness to Mr. Jones for much valuable advice and assistance at the inception of this journal; indeed THE SANITARY ENGINEER is under obligations to the *American Grocer* for many words of encouragement and for earnest support in all its efforts to secure legislation to prevent the adulteration of food and drugs and the repression of other abuses.

Mr. Jones as the retiring editor and Mr. Barrett as his successor have both our very best wishes, and we believe that under the new management the *American Grocer* will continue to be the leading paper of its class in this country, and exert the influence that an honest, fearless and out-spoken journal is sure to possess.

NOTES.

Dr. James G. Hunt has been reappointed Health Officer of Utica, N. Y.

Mr. Henry M. Wightman has been re-elected City Engineer of Boston receiving 56 of the 59 votes cast in Common Council.

Foreign exchanges mention the death of Mr. George Wythes, of Bickley Hall, Kent, He was engaged in railway contracts with the late Mr. Brassey and other men equally known to fame in the world of engineers. One of his efforts was the construction of a portion of the Great Indian Peninsular Railway.

The Public Health Committee of the Massachusetts Legislature have before them a bill to prevent the transportation by any railrord, or other common carrier, of the remains of any person who has died of small-pox, scarlet fever, diphtheria or typhoid fever.

The Maine Central is trying a new system of heating its cars by steam from the locomotive.

A story is going the rounds that a sewer workman has received $50,000 from the Directors of the Bank of England for revealing to them the fact that it was possible to enter the bullion room of the bank through a sewer connection, of which they were entirely ignorant. The workman astonished the directors by appearing in their midst according to appointment, while they were meeting at midnight to see him fill his promise that he could enter the bank by a means unknown to them. So goes the story.

The officers of the new Board of Health of Westfield, Staten Island, are H. R. Tetman, President, S. Webb Hopping, Secretary, and Dr. George C. Hubbard, Health Officer.

The New Haven, Ct., sanitary inspectors have begun the early spring examinations, and find much filth that should be removed immediately.

A sanitary convention will be held at Reed City, Mich., April 26 and 27, under the auspices of the Michigan State Board of Health.

CHOLERA IN TEHUANTEPEC.

We have received from the National Board of Health a copy of a communication received by it from J. A. Sutter, U. S. Consul at Acapulco, Mexico, relative to an outbreak of cholera in Tehuantepec, which we condense as follows:

"This disease first appeared in Tehuantepec on the 13th of December, 1882, and steadily increased during the following fortnight, the number of deaths daily being 50 to 100. In January the epidemic diminished, but had not entirely disappeared until the middle of the month. The disease usually lasted from two to three days, but in some cases proved fatal within from four to eight hours, presenting all the symptoms of genuine Asiatic cholera. There was but one physician in Tehuantepec at the time, and he fell a victim to the disease, so that no professional observations on the cases are available. The total number of deaths is estimated as being from thirteen to fourteen hundred, out of a population of about 15,000. The same disease prevailed in the surrounding villages, but nothing is known as to the number of cases or deaths."

ST. JOHN, N. B., WATER SUPPLY.

Mr. Gilbert Murdoch, M. Am. Soc. C. E,, the Superintendent of the Water and Sewerage Works of St. John and Portland, N. B., has made a thorough and interesting report on the water supply of these cities in compliance with an order of the Water and Sewer Commissioners. A sketch of the history of the former and present water works for supplying water is first given, from which it appears that in 1836 a private company constructed works taking their supply from Lily lake about 80 feet above tide water. The water was pumped into a badly constructed reservoir, and was found, after all, to be of poor quality and insufficient quantity. In 1850–1 the supply had been intermittent for several years, water being turned on for only two hours a day, and new works were constructed taking the supply from Little river, 160 feet above the city base of levels, but only ten feet above the highest parts of the city.

The city purchased the works in 1855, and has since laid additional supply mains, so that at present there are three pipes, one of 12-inch, and two of 24-inch, between the reservoir and the city.

The consumption is great, however, and the supply inadequate on the higher levels of the city. This is particularly the case during cold weather, owing to excessive waste in the lower part of the city caused by leaving faucets open to prevent pipes from freezing. In Jan. 1882 some inspections made showed that twenty consumers were wasting an average of 4.458 U.S. gallons each per day, and that 154 reported at the same time were wasting 3,644 gallons each per day. Mr. Murdoch says in this connection, "Inspections and penalties may palliate the injurious effects of this waste, but they are quite inadequate for its total suppression. They have failed everywhere to meet the difficulty, and one of two causes is now generally recognized as the true way to remedy this evil (1), the general application of meters, or (2), to accept this winter consumption as a necessity of our climate and provide for it accordingly. The last-named course is most consistent with advanced thought on the hygienic value of copious supplies of wholesome water, and is likely to become the more popular of the two when water can be had in abundance at a reasonable outlay."

Without endorsing Mr. Murdoch's opinions as to the hygienic advantages of wastefulness in the consumption of water, it may be said that the facts which he has collated in his report, relative to the steady decrease of pressure in the mains as the consumption increases, and the imperative necessity shown to exist for a greater and better regulated supply, are most interesting and well presented.

Dividing the city into four districts arranged topographically, he shows from the records that between the planes of 120 and 160 feet below the reservoir the average loss of effective head during the last six years has been 14.34 feet and in the three belts of 40 feet height each above the first, the loss has been respectively 12.52 ft., 12 ft. and 8.5 ft.

The actual difference between the static head and the head found in the mains, ranges from 39 feet on the lower levels to 22 feet on the higher, sufficient, it is plain, to inconvenience the whole city and seriously incommode the higher portions.

To remedy this evil, Mr. Murdoch proposes to extend the supply mains to one of a series of lakes on the head waters of Little river, and about 275 feet above the city datum, and connect the same with Loch Lomond, a fine sheet of excellent water and large drainage area on the head waters of Mispech river. The city would be divided into two belts of high and low service, for distribution purposes, the present Little river reservoir supplying the low, and the new proposed reservoir, the high service. The estimated cost of bringing in an additional supply of 10,000,000 gallons daily, is estimated at about $250,000. The report is accompanied by a fine map, and is altogether a document most creditable to the author.

Construction Notes.

ROANOKE, VA.—A report has been presented to the City Council, by D. W. Flickwir, and J. H. Skinker, City Engineer, recommending the system of sewerage proposed by Mr. Rudolph Hering, with some modifications. The cost is estimated at $29,262.50.

DENISON, TEXAS.—The Denison Water Supply Company has been granted a franchise to lay pipes in the streets for furnishing water for domestic and fire purposes.

FORT WORTH, TEXAS.—M. S. Hall has been awarded the contract for sewering the city, for $22,450.

BOSTON, MASS.—The Water Board have awarded the contract for cast iron water pipe for the Cochituate Department to D. D. Wood & Co., of Philadelphia. A. H. Micheal, of Burlington, N. J., received the contract for pipe for extension of 48-inch main.

BROOKLYN.—The following bids for a new 36-inch force main, to connect the fourth engine at the Ridgewood pumping station with the distributing reservoir, were opened on the 19th inst., by the Commissioner of City Works:

Thomas McCann	$ 5,985 co
Freel & McNamee	7.502.co
Thomas Newman	7,844.10
M. J. Dady	7,943.10
D. H. Valentine	8,694.60
Seth L. Keeney	12,956.00
Benj. F. Stephens	14,815.15

BROOKLYN.—We take the following particulars about the proposed water main for the Eastern District from the Brooklyn *Eagle*: For 18,300 feet of the route selected, the main will be 36-inch pipe; for 3,700 feet, 30-inch, and for 7,634 feet, 20-inch. The total cost of the main will not be much short of $250,000, the cost of laying the pipe alone being estimated at $50,000. Purveyor Milne is preparing specifications for the whole work, and the Commissioners will advertise for proposals next week.

ALBANY, N. Y.—The Aldermen have adopted a resolution that a special committee of five be appointed by the president of the board, to whom shall be referred the matter of the water supply, and the recommendations of the water commissioners, as contained in their reports of 1881 and 1882, to report to the Aldermen. Also, that the committee on application to the Legislature apply for the passage of a law authorizing the City of Albany to issue Albany city water bonds to the amount of $150,000, for the purpose of cleaning out the reservoirs, building a new reservoir (if necessary), or increasing the storage capacity of the present reservoirs.

NASHVILLE, TENN.—The City Council have before them the question of the ratification of the contract with the Holly Manufacturing Company to furnish three 5,000,000 gallon engines, as made by the Water Works Commission.

ROCHESTER, N. Y.—Until April 6, proposals will be received for a wrought iron bridge over the Genesee River, on Atwater street, by the Executive Board, at the City Hall.

CHICAGO.—The Council Committee recommend for passage an ordinance authorizing the Merchants' Union Telegraph Company to lay underground wires in the streets and alleys. The committee have also placed on file ordinances authorizing the Western Electric Company to lay underground wires, and the Mutual Union Telegraph Co. to erect and maintain aerial cables in the streets.

The Council Committee approves an appropriation of $509 874 93 for public works this year, including $22,000 for Chicago harbor and $55,000 for canal pumping works.

SAN FRANCISCO, *March* 22.—Mayor Bartlett has signed the water ordinance passed last week by the Board of Supervisors, which fixes the rates for the city at about 25 per cent. lower than at present.

SAN JOSE, CAL.—The Manzanita Water Company has been incorporated at San Jose, to furnish water in Santa Clara and San Mateo counties and to the city of San Francisco. The capital stock of the company is $1,000,000, divided into 10,000 shares, and it is understood that the water supply will be taken from the Tuolumne River. —*Engineering News.*

ALBANY, N. Y.—At a meeting of special committeee of the Common Council, March 22, sub-committees on water supply, and on distributing mains, etc., were appointed. It has been recommended that an analysis of the city water be made.

The *Chicago Times* says that petitions are circulating for the sewerage of the whole of Woodlawn.

The Montreal Board of Works give farmers the street sweepings if they will cart them away.

A report by Colonel J. J. Daniel, of the Board of Sanitary Trustees, to the Jacksonville, Fla., Council, recommends the appropriation of $50,000 to do the work required in securing a supply of water.

Philadelphia City Council passed an ordinance the 15th inst., appropriating $210,000 for extension of water works.

Mr. Harry Oldrich read on March 5, before the Society of Engineers, London, a description of works erected by Baron de Podewils for disposing of the sewage of Augsburg, in Bavaria. The matter is deposited in air-tight tanks the gases from which are drawn into the draft of a furnace and consumed. It is then drawn to a mixer where sulphuric acid is added, thence to a fumigating pan, thence to a series of ore evaporators, thence to a drying machine and thence to a disintegrator, coming out as a powder "as good as imported guano."

The works are capable of disposing of the excrement of 17,000 people. It is collected in pails and not through sewers. The system has been in operation three years and the works pay 20 per cent. dividends. The manure is sold at $45 to $50 per ton.

The City Council of New Orleans have passed an ordinance, making it unlawful for any person to use water from wells, canals or gutters, for drinking or for making bread, or for making anything else which is to be eaten or drunk, or for washing pots, pans, dishes or other vessels in which food or drink is to be placed.

It is made the duty of each and every owner of a building or premises, whether he occupies it himself or rents it to others, to provide and furnish said premises with an adequate supply of water for all purposes by either connecting the same with the water works or by providing cistern capacity equal to 200 gallons for each habitable room.

The water works of the town of Lake, Ill., supply now 3,211 houses, and the receipts from water rents in 1882 were $49.200.99. The daily consumption was 3,317,636 gallons or 1,033 gallons per service.

There are 55 miles of water pipe and twelve miles of sewers.

Since 1856 the several boards of works controlling the city of London have constructed 919 miles of sewers, paved 11,745,875 square yards of streets and erected 26,444 new street lamps. There were in 1856, 925 miles of streets, and in 1881, 1,607 miles in the metropolis. On these improvements $57,000,000 have been expended in 25 years.

When Ridgewood reservoir in Brooklyn was built in 1857, there were several cemeteries in the vicinity. The main pipe line to the city passed through Evergreen Cemetery, greatly to the disgust of some citizens who were afraid the water would be contaminated thereby. A law was passed in 1868 forbidding interments within half a mile of the reservoir. It is reported that a new Jewish cemetery has been laid out below the reservoir and certain citizens are afraid that it will injure the water.

AWARD OF GOVERNMENT CONTRACTS.

Custom House, Memphis, Tenn. Synopsis of bids opened March 22, 1883, for sheet copper, circular letters, of March 12, 19, and 20, 1883:

	24-inch and 48-inch. 12 *oz. per lb.*	14 *oz. per lb.*

New Pension Building. Bids for bar iron ties were opened March 20, in the office of the Supervising Architect of that building. Twelve bids for furnishing about 0 tons of rolled wrought iron bars, 41, 16 and 1 foot long, or ties and anchors for walls of new Pension Office, as follows:

Bidders.	Place of Delivery	Price per pound. 41 ft. Bars.	16 ft. Bars.	1 ft. Anchors	Remarks.
		Cents.	Cents.	Cents.	
J. F. Bailey, Philadelphia	Washington	2.3	2.3	2.3	Tensile strength
		2.5	2.5	2.5	45,000 lbs, sq. in.
Albany & Rens. Steel and Iron Co., Troy, N. Y.	N. Y. City.	2.9	2.9	2.7	48,000 " "
Jas. Rowland & Co., Philadelphia	Washington	2.8	2.7	2.7	* * *
Allentown Rolling Mills, Philadelphia	"	2.5	2.5	2.5	* * *
Tredegar Iron Works, Richmond, Va.	"	2¾	2¾	2¾	* * *
Phœnix Iron Co., Philadelphia	"	2.7	2.7	2.7	* * *
Morris Wheeler & Co., Philadelphia	"	2¾	2¾	2¾	* * *
Pencoyd Iron Works	"	2.73	2.73	2.73	* * *
N. J. Steel & Iron Co., Trenton, N. J.	"	2⅝	2⅝	2⅝	* * *
James McGill, Washington	"	2.37	2.37	2.37	* * *
C. A. Schneider's Sons, Washington	"	2 9-20	2 9-20	2 9-20	* * *
J. B. Kendall, Washington	"	2.39	2.39	2.39	* * *

* All this is to have tensile strength of 22 tons to the square inch. 49,280 lbs.

The lowest bidders for cut stone for the new Pension Building were Taylor & Lowe, $1.565.00 for sand stone; Middleton, Leme & Co., $1,949.00 for Granite. No award as yet.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

A regular meeting of the Society of Civil Engineers was held on the evening of March 21. Vice-Pres. Wm. H. Paine in the chair. The secretary announced the death of James O. Morse, one of the oldest members of the society. The Secretary, Mr. Bogert, spoke briefly of the deceased in terms of praise and a resolution authorizing the chair to appoint a committee to prepare a memoir was unanimously adopted.

A report was made by Mr. Chanute of the efforts of the Society to get the last Congress to appropriate money for the making of systematic tests of structural material. A sum of $123,000 was asked for to be expended as follows: For the care and operation of the government testing machine at the Watertown arsenal, $10,000; for the purchase of material, $13,000; for the construction of a machine for torsional tests, $50,000, and for a machine for transverse tests, $50,000. The bill appropriating these amounts failed to pass, but the first item was secured by inserting it in the army appropriation bill, which contained a clause directing the Chief of Ordinance to give attention to the requests of the Society for special tests. A programme prepared by the Society has been approved by the Chief of Ordinance and with his coöperation good results are looked for, notwithstanding the failure to obtain the desired appropriation. Manufacturers are expected to furnish material and the freight will be paid by the Ordinance Department. Records of such tests will be furnished the Society and published at their expense.
